Chang Gung Memorial Hospital
Chang Gung University, Taiwan

March 3, 2015

Mechanism of SJS/TEN

- Drug antigens
- Environmental factors
- Host factors:

  Genetics: HLA and non-HLA associations

  Non-genetic factors

  Immune mechanism:

    drug-peptides/proteins-HLA-TCR interaction

    immune molecules and cytotoxic proteins

  Cell death mechanism

  Therapeutic targets

Historical milestones of SJS/TEN research

Table 3 Key dates and publications related to epidermal necrolysis.

Date	Author(s)	Concept	Refs
1866	von Hebra	Erythema exsudativum multiforme	12
1916, 1917	Rendu, Fiessinger and Rendu	Multiorificial ectodermosis	13,14
1922	Stevens and Johnson	Stevens–Johnson syndrome	15
1939	Debré et al	Bullous erythroderma with epidermolysis	11
1956	Lyell	Toxic epidermal necrolysis	1
1968	Bergoend H et al	High risk of long-acting sulfonamides	18
1968, 1970	Billingham and Streilein, Streilein and Billingham	TEN and a graft-versus-host model in hamsters	37,38
1970	Mellish and Glasgow	Staphylococcal scalded skin syndrome	3
1972	Peck et al	Human graft-versus-host reaction as a cause of TEN	39
1972	Kauppinen	Drug rechallenge often negative in SJS and TEN	9
1985	Ruiz-Maldonado	ADEN types 1, 2, and 3	22
1985	Revuz et al	First international meeting on TEN, Créteil, France	—
1985	Lyell A (Créteil meeting)	The Jackpot hypothesis	—
1986	Roujeau et al	Mild links between HLA and TEN	58
1987	SCAR study group	Initiation of multinational case-control study on EN	—
1990	Roujeau and Revuz	Acute skin failure	64
1993	Correia et al	Studying T cells in blister fluid of TEN	43
1993	Bastuji-Garin et al	Consensus definition of EEMM, SJS, and TEN	23
1995–2002	Pichler et al	Drug-specific T cell clones, p-i concept	44–47
1995	Roujeau et al	Results from first case-control study of drug risks in EN	32
1998	*Viard I, et al.*	Inhibition of Toxic Epidermal Necrolysis by Blockade of CD95 by IVIG	
2002	Nassif et al	Drug-specific cytotoxic cells in blister fluid of TEN	48
2004	Chung et al	Carbamazepine (CBZ)-related TEN and HLA-B*15:02	29
2005	Hung et al	Allopurinol-related TEN and HLA-B*58:01	59

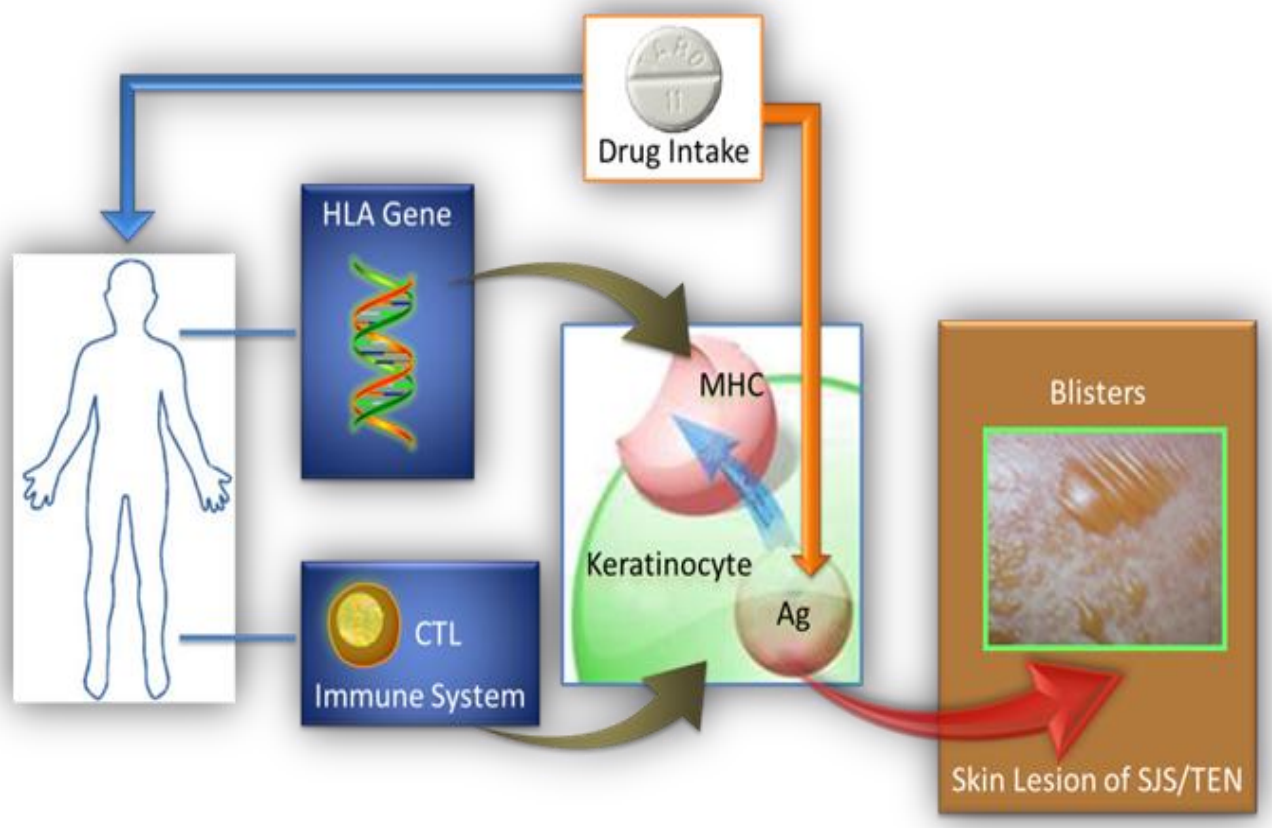
2008	Chung et al	Granulysin as the key cytokine in necrolysis	50
2011	Ko et al	Restricted TCR needed for CBZ-related SJS/TEN	52
2011	Genin et al	GWAS on a large European series of SJS/TEN cases	60
2012	Wei et al	Direct noncovalent link between CBZ and HLA-B1502	53
2012	Chen et al	Eradication of CBZ-induced TEN from Taiwan	63
2013	Sekula et al	SJS/TEN even more severe than suspected	28

ADEN = acute disseminated epidermal necrosis; EN = epidermal necrolysis; GWAS = genome-wide association studies; HLA = human leukocyte antigen; p-i concept = pharmoco-immune concept; RCT = randomized controlled trial; SCAR study = Severe Cutaneous Adverse Reactions study; SJS = Stevens–Johnson syndrome; TCR = T-cell receptor; TEN = toxic epidermal necrolysis.

Adapt from Jean-Claude Roujeau, Dermatologica Sinica, 2013

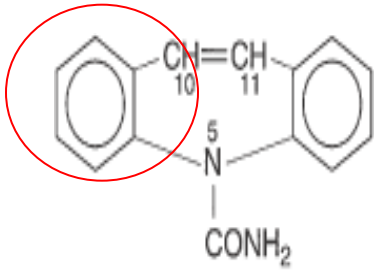
Pathogenesis of SJS/TEN



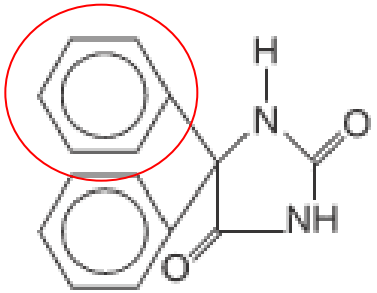
$$\text{Frequency / Severity of Drug Hypersensitivity} = f_1\left(\text{Chemistry of drug}\right) + f_2\left(\text{Biology of individual}\right)$$

Werner J. Pichler,et al. J Allergy Clin Immunol 2011
Chung WH et al, J Dermatol Sci, 2012

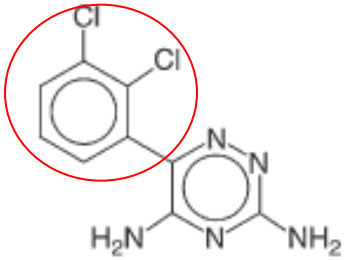
Chemical structures of aromatic antiepileptic drugs frequently associated with SJS/TEN



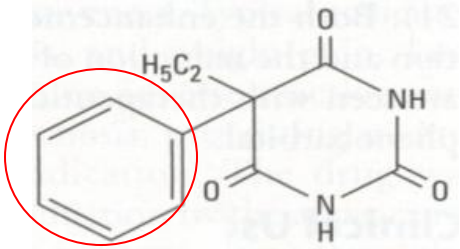
CARBAMAZEPINE



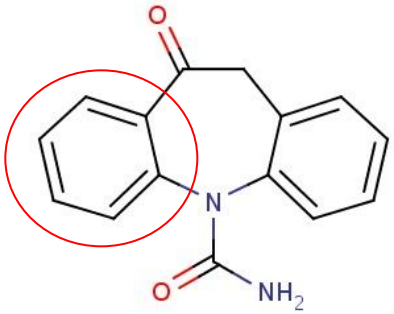
PHENYTOIN



LAMOTRIGINE

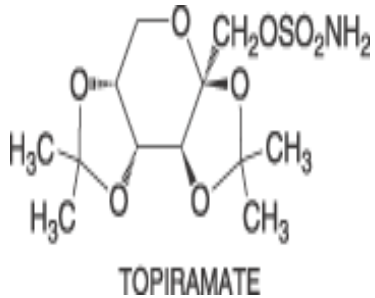


Phenobarbital

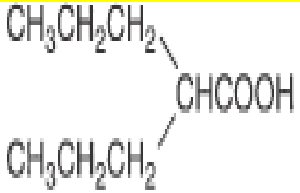


Oxcarbazepine

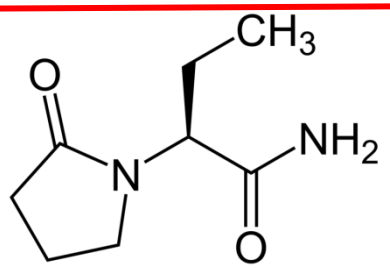
Non-aromatic AED



TOPIRAMATE



VALPROIC ACID



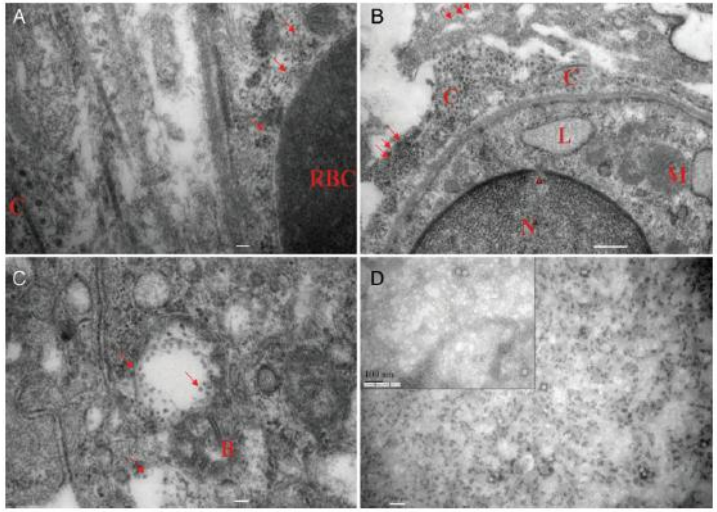
Levetiracetam

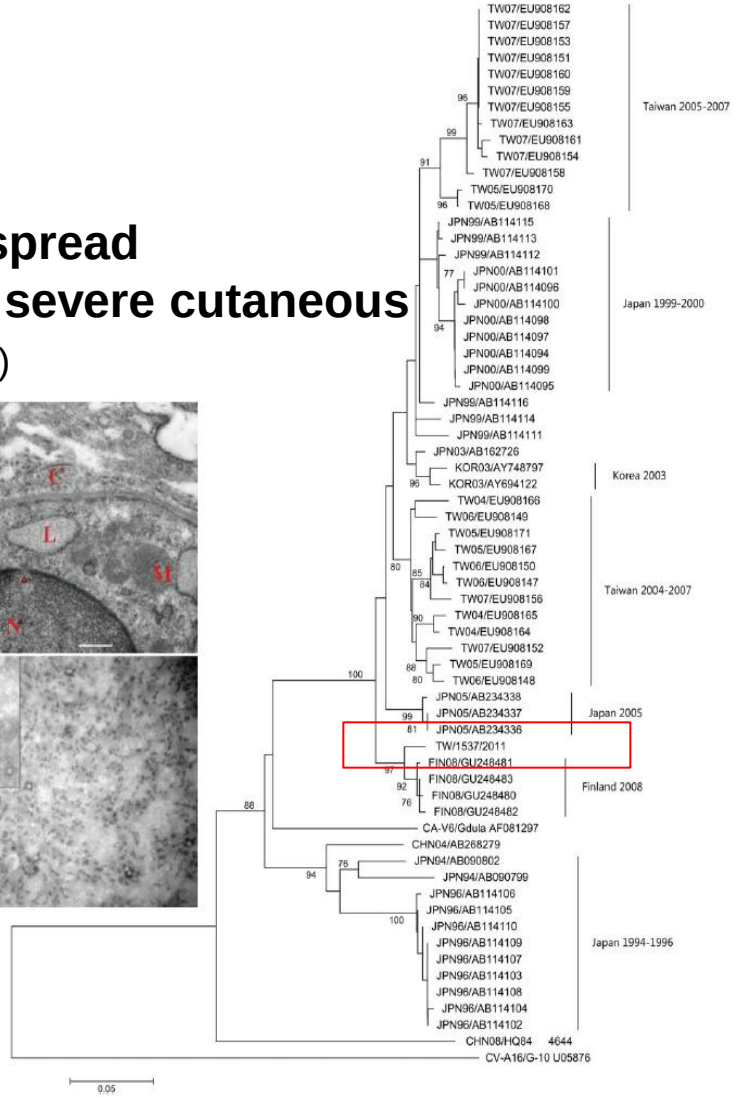
Pan et al., Current Immunology Reviews, 2014

Environmental factors

Mycoplasma
HSV
~20% Unknown ?

Coxsackievirus A6 new variant induced widespread mucocutaneous bullous reactions mimicking severe cutaneous adverse reactions (Chung WH et al ., J Infect Dis. 2013)





Host factors- genetics

Association of serious drug hypersensitivity and HLA alleles

¶ Department of Pediatrics, Duke University Medical Center, Durham, North Carolina 27710, USA

Table 1 **Frequency of *HLA* alleles in patients with Stevens–Johnson syndrome**

HLA allele	*CBZ–SJS*	*CBZ-tolerant*	*Normal*
*B*1502*	44 (100%)	3 (3%)*	8 (8.6%)†
*Cw*0801*	41 (93.2%)	17 (16.8%)	13 (14%)
*A*1101*	36 (81.8%)	51 (50.5%)	53 (57%)
*DRB1*1202*	33 (75%)	12 (11.9%)	18 (19.4%)
*B*1502, Cw*0801*	41 (93.2%)	3 (3%)	7 (7.5%)
*B*1502, A*1101*	36 (81.8%)	2 (2%)	6 (6.5%)
*B*1502, DRB1*1202*	33 (75%)	1(1%)	5 (5.4%)
*B*1502, Cw*0801, A*1101, DRB1*1202*	29(66%)	0 (0%)	3 (3.2%)

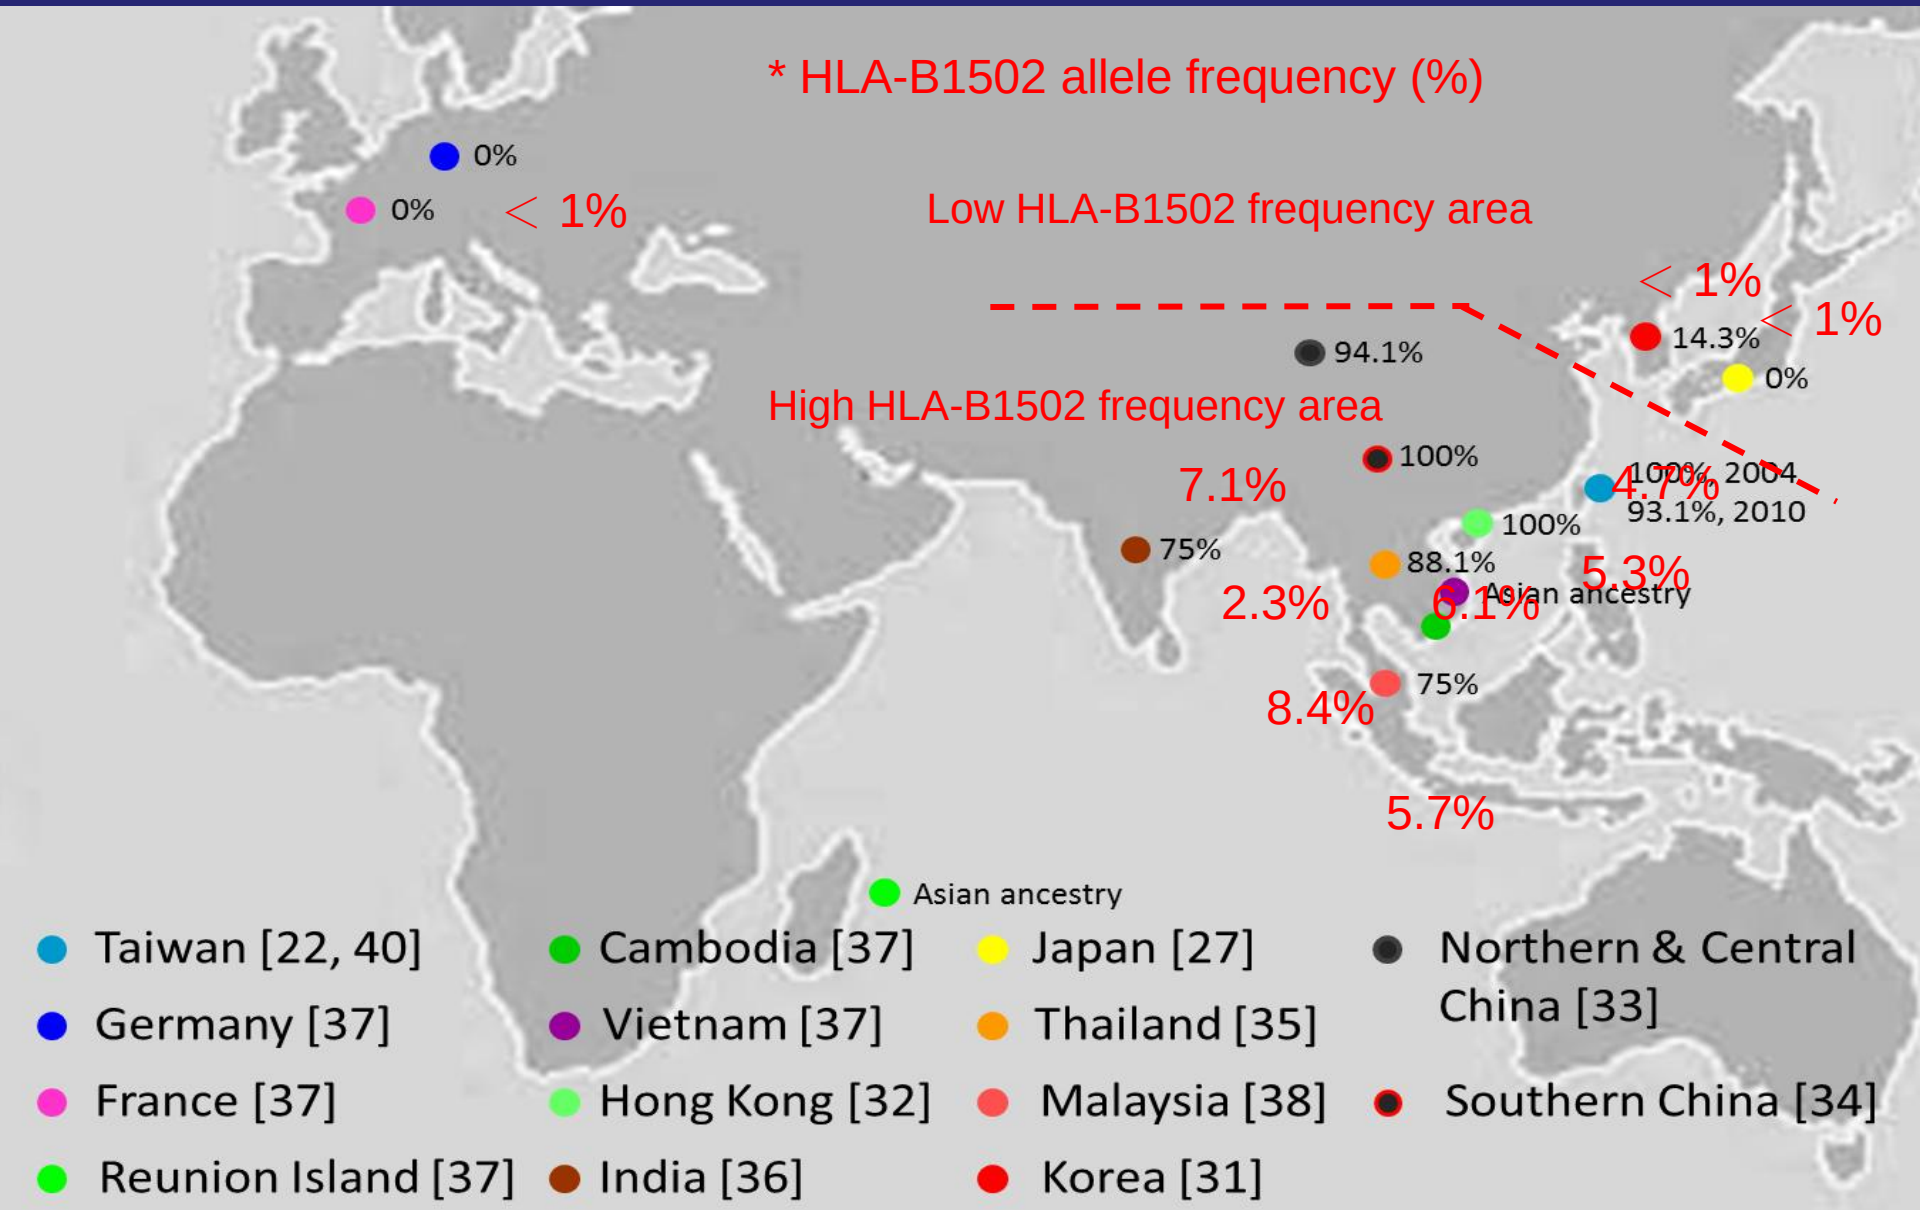
Frequencies (by number and percentage) of individual or combined loci of the *B*1502* ancestral haplotype are shown in patients with carbamazepine-induced Stevens–Johnson syndrome (CBZ–SJS; $n = 44$), and in carbamazepine-tolerant ($n = 101$) and normal subjects ($n = 93$). For methods, see supplementary information.

*Odds ratio (CBZ–SJS/CBZ-tolerant): 2,504 (95% CI, 126–49,522); corrected *P* value $P_c = 3.13 \times 10^{-27}$.

†Odds ratio (CBZ–SJS/normal): 895 (95% CI, 50–15,869); $P_c = 1.38 \times 10^{-21}$.

Association of HLA-B*1502 with CBZ-SJS/TEN in different populations

WH Chung , Journal of Dermatological Science (2012)



Phenotype & Genotype : HLA-B*1502 in CBZ-cADR (n=194)

Follow-up study in Taiwan

Phenotypes (% BSA detachment)	No. with HLA-B*1502 (%)	Total No.	Odds Ratio	(95% CI), p-value
SJS/TEN (all)	99 (88%)	112	97.6	(42.0 - 226.8), $p=1.6\times10^{-44}$

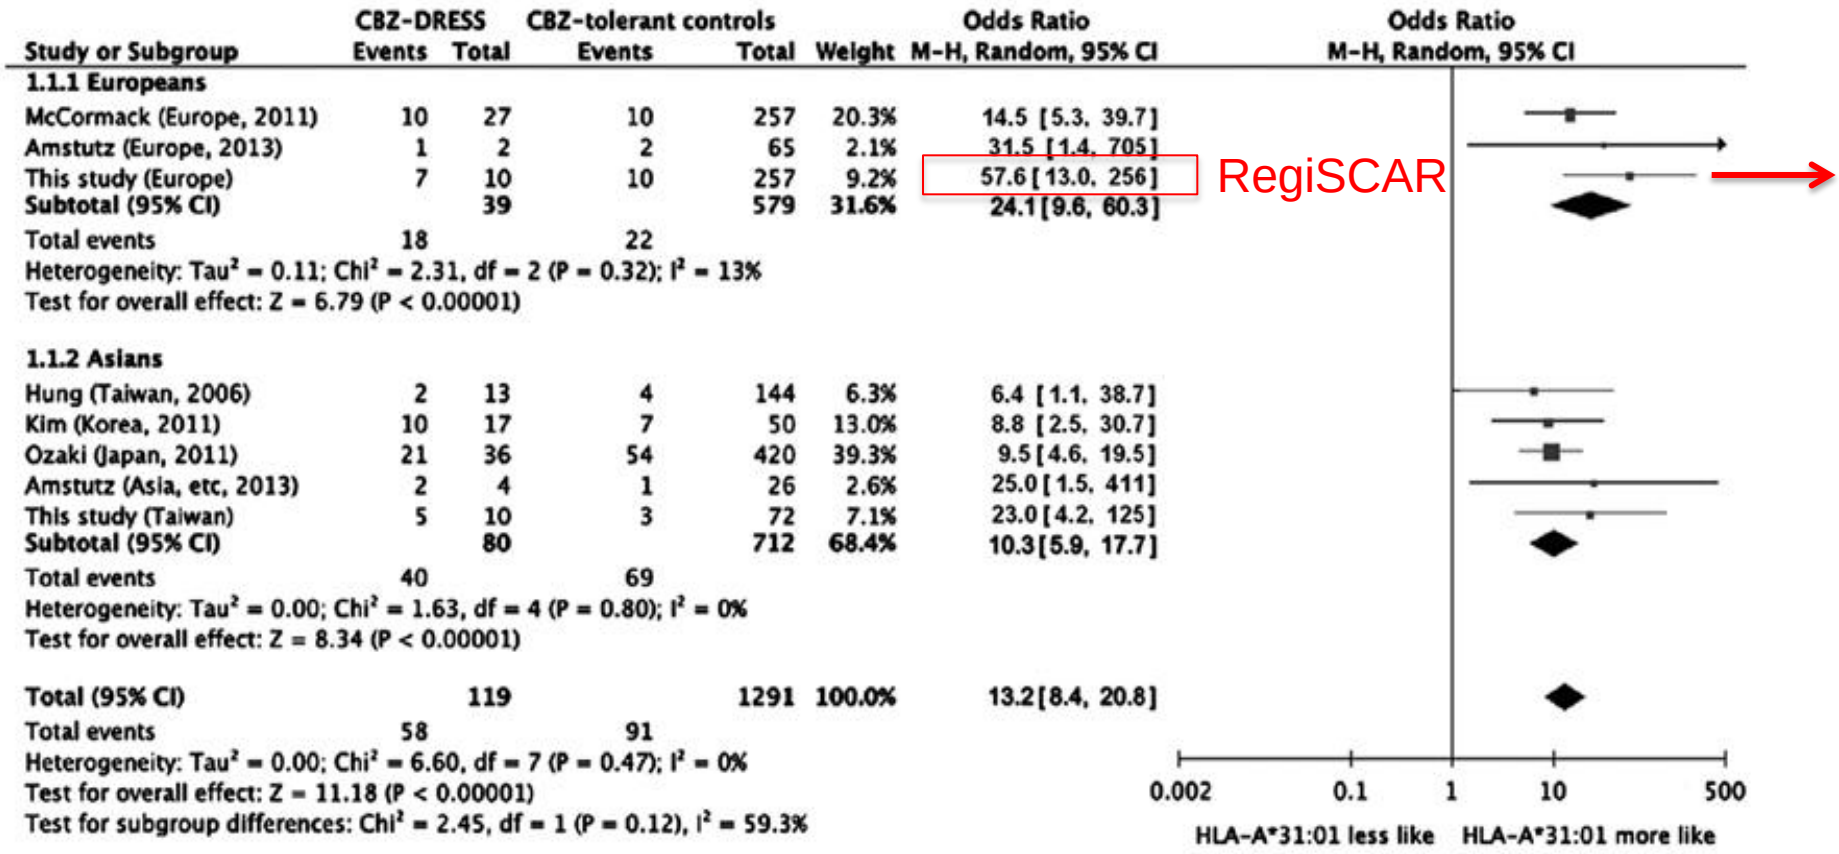
ORIGINAL ARTICLE

*HLA-A*31:01* and different types of carbamazepine-induced severe cutaneous adverse reactions: an international study and meta-analysis

E Genin[1,12], D-P Chen[2,3,12], S-I Hung[4,12], P Sekula[5], M Schumacher[5], P-Y Chang[2,3], S-H Tsai[2,3], T-L Wu[2,3], T Bellón[6], R Tamouza[7,8], C Fortier[7,8], A Toubert[7,8], D Charron[7,8], A Hovnanian[8], P Wolkenstein[8], W-H Chung[9], M Mockenhaupt[10] and J-C Roujeau[11]

HLA-A3101 is strongly associated with CBZ-DRESS in all populations



HLA-A*31:01 shows weaker association with CBZ-SJS/TEN of Europeans from RegiSCAR study: only (+) in 3/20

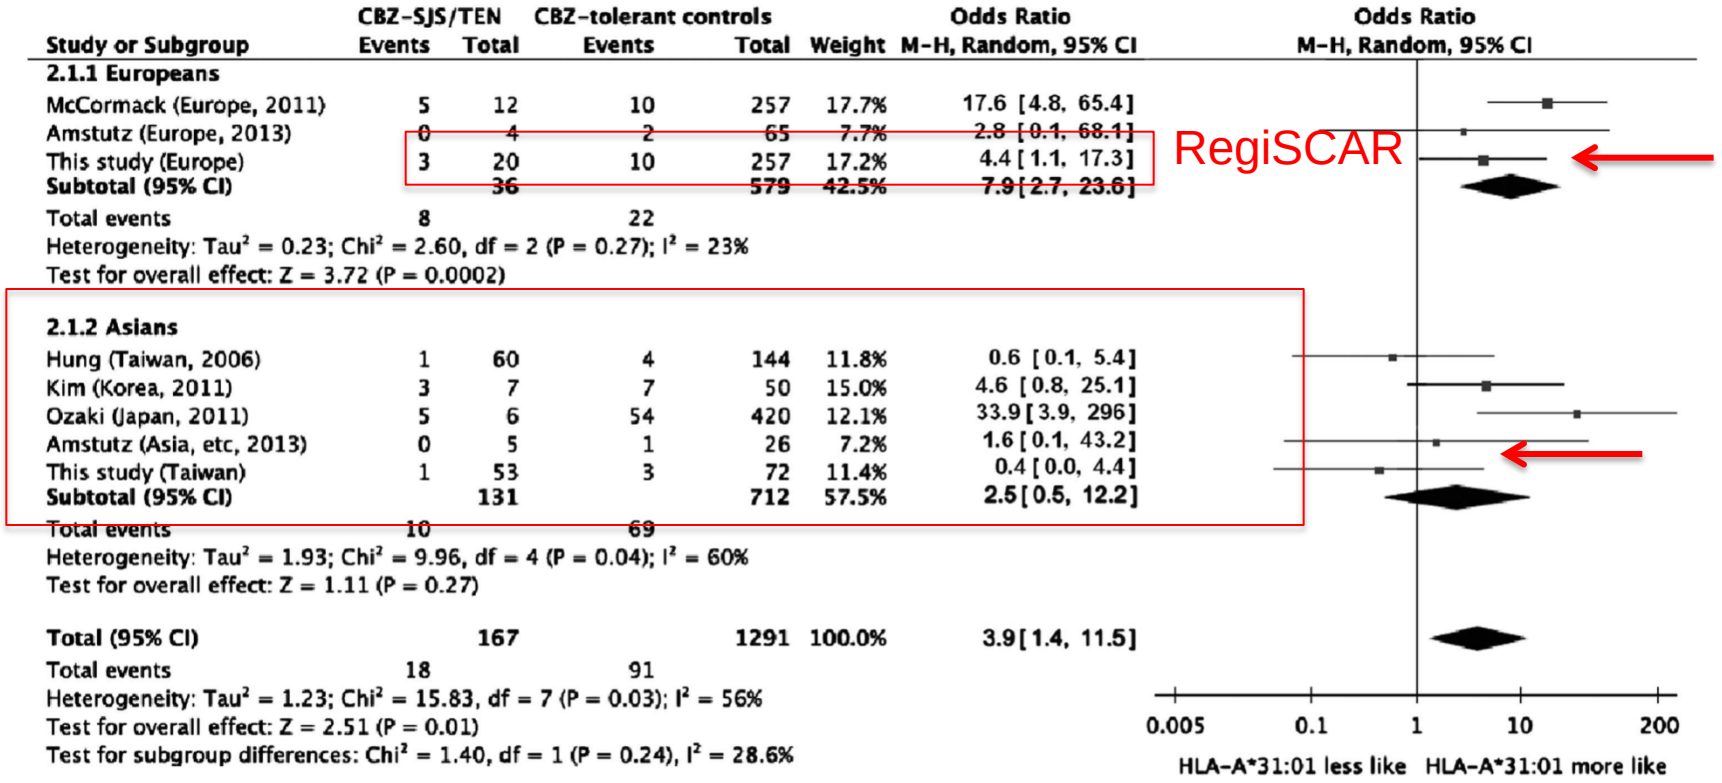


Figure 2. Analysis of the association between *HLA-A*31:01* and carbamazepine (CBZ)-induced Stevens–Johnson syndrome/toxic epidermal necrolysis (SJS/TEN) in multiple populations against tolerant controls. Events represent the carriers of *HLA-A*31:01*. Studying weighting (indicated by the squares) refers to the proportion of subjects who were recruited from each study. Tau^2 and I^2 represent the measures of heterogeneity. Diamonds represent pooled odds ratios (ORs), and horizontal lines indicate 95% confidence intervals (CIs). The data published in the literatures and in the present study was used for meta-analysis.[15,23,24,35,36] d.f., degrees of freedom; M–H, Mantel–Haenszel method.

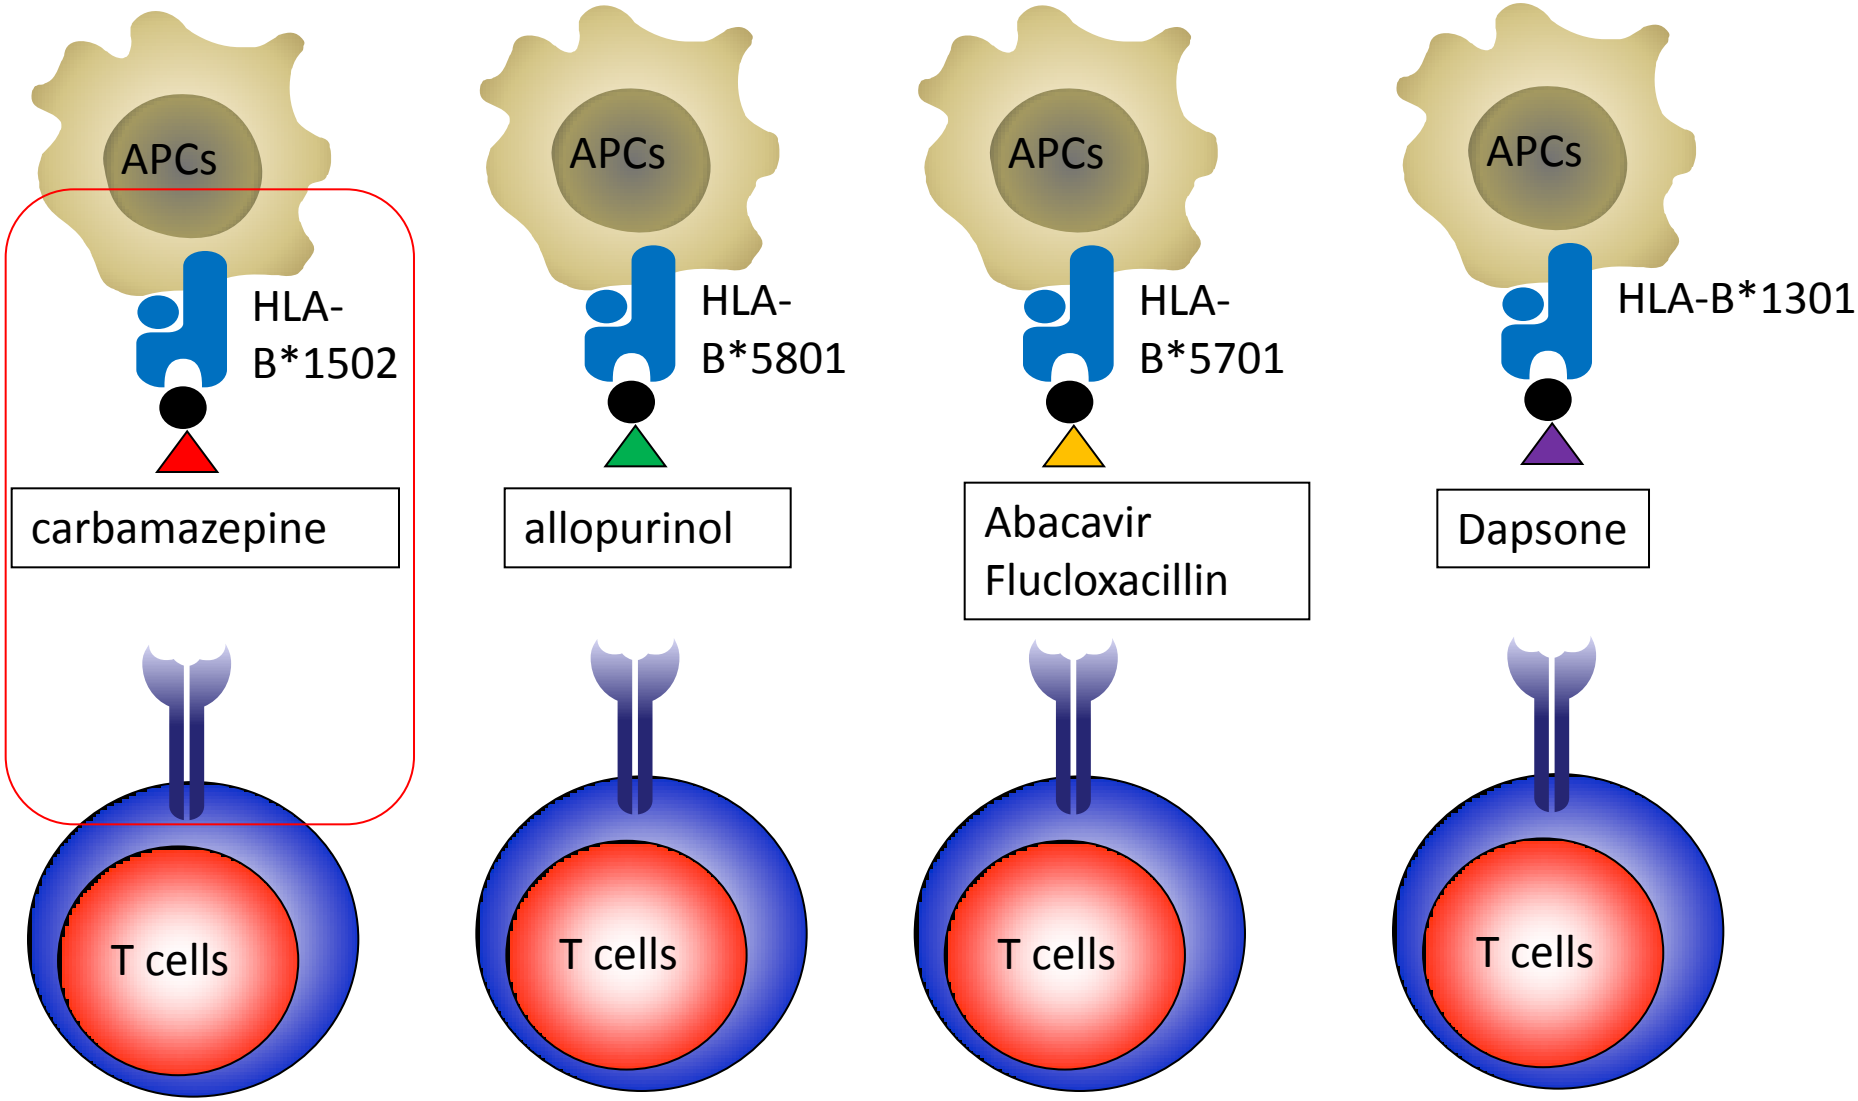
[d] Case: Allopurinol-SJS/TEN; Control: Tolerant control.

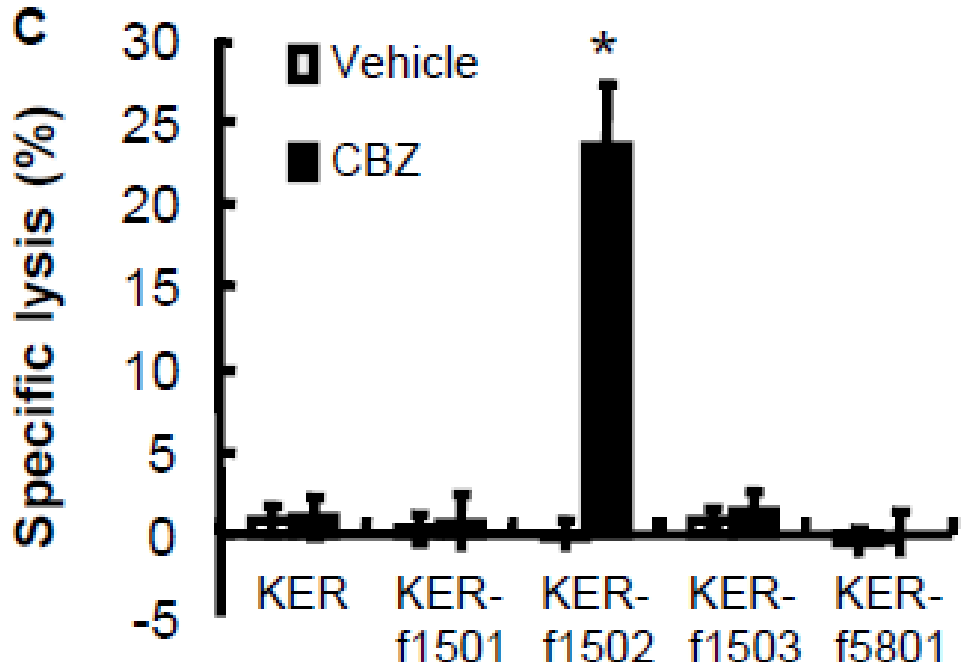
* Adjusted using Bonferroni's correction for multiple comparisons to account for observed alleles.

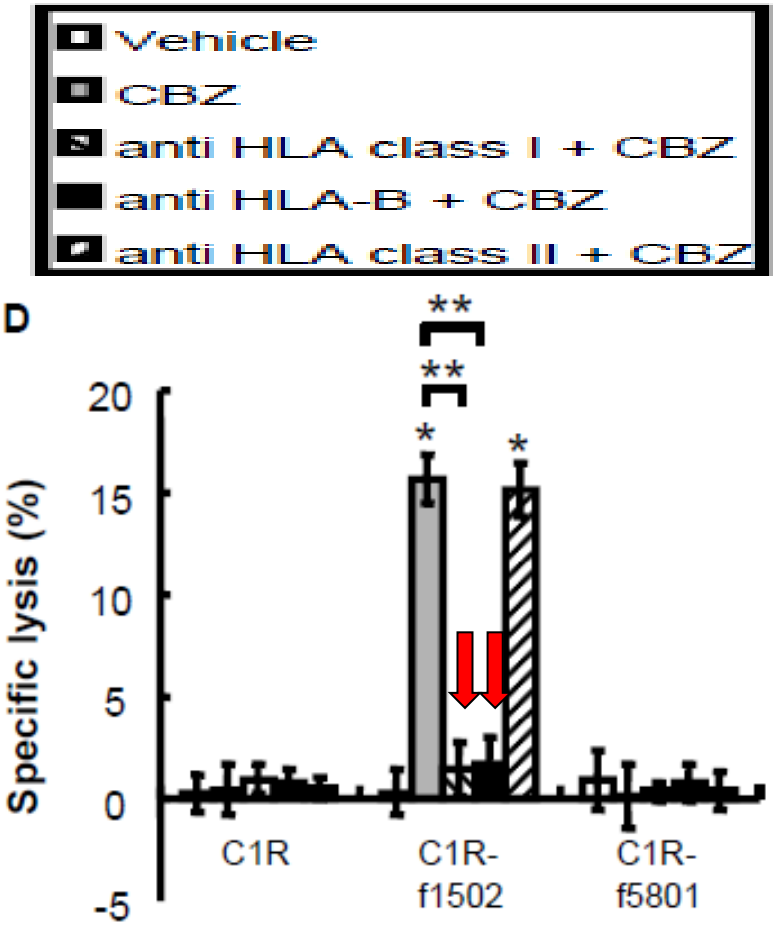
Role of HLA in drug hypersensitivity: HLA-restricted

Hypothesis: HLA proteins have different affinity to the drug/peptide complex.



HLA-B*15:02-dependent cytotoxicity of CTL in carbamazepine (CBZ)-induced SJS/TEN





- Stable transfection of different HLA-B cDNAs into C1R B cells, or keratinocytes.
- CBZ-SJS CTLs only kill target cells expressing B*15:02.

- Abolish the cytotoxicity of CTL by anti- HLA class I/HLA-B antibodies

Wei CY, et al. JACI, 2012

The same HLA serotype members (B75) could present CBZ to T cells.

Other HLA-B*15 subtypes associated with CBZ-SJS/TEN in different ethnic populations

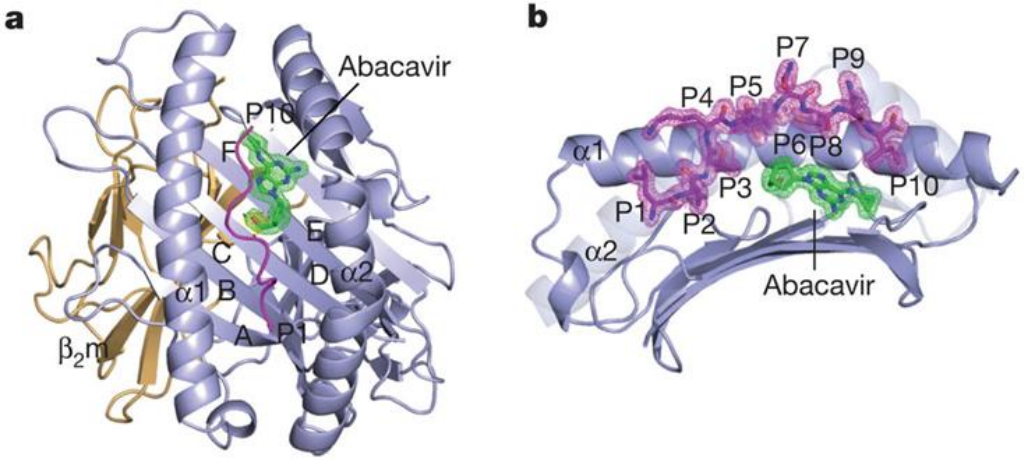
LETTER

Nature 2012, May

doi:10.1038/nature11147

Immune self-reactivity triggered by drug-modified HLA-peptide repertoire

Patricia T. Illing[1,2], Julian P. Vivian[3], Nadine L. Dudek[2], Lyudmila Kostenko[1], Zhenjun Chen[1], Mandvi Bharadwaj[1], John J. Miles[4,5], Lars Kjer-Nielsen[1], Stephanie Gras[3], Nicholas A. Williamson[2], Scott R. Burrows[4], Anthony W. Purcell[2]*, Jamie Rossjohn[3,5]* & James McCluskey[1,6]*



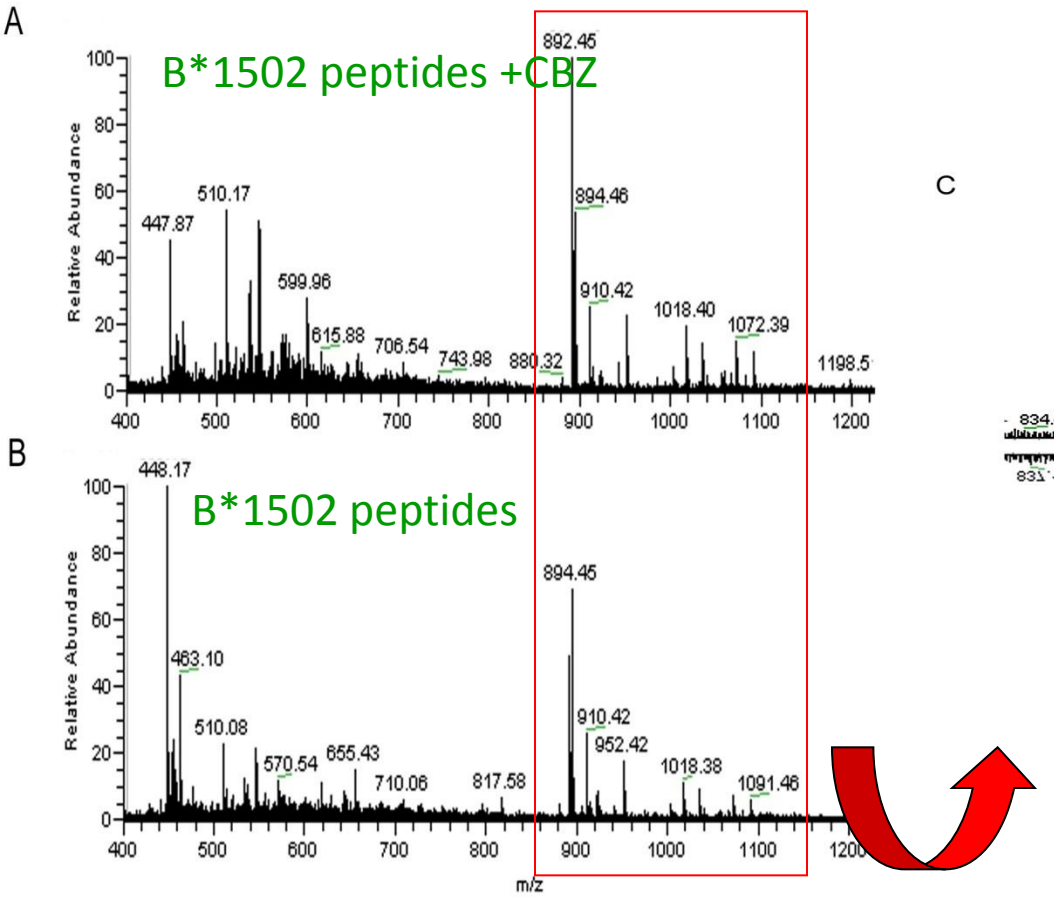
Abacavir (ABC) binds to the F-pocket of HLA-B*57:01;

the ABC filled F-pocket leads to selection of peptides with valin at position 9 (instead of tryptophan / phenylalanin)

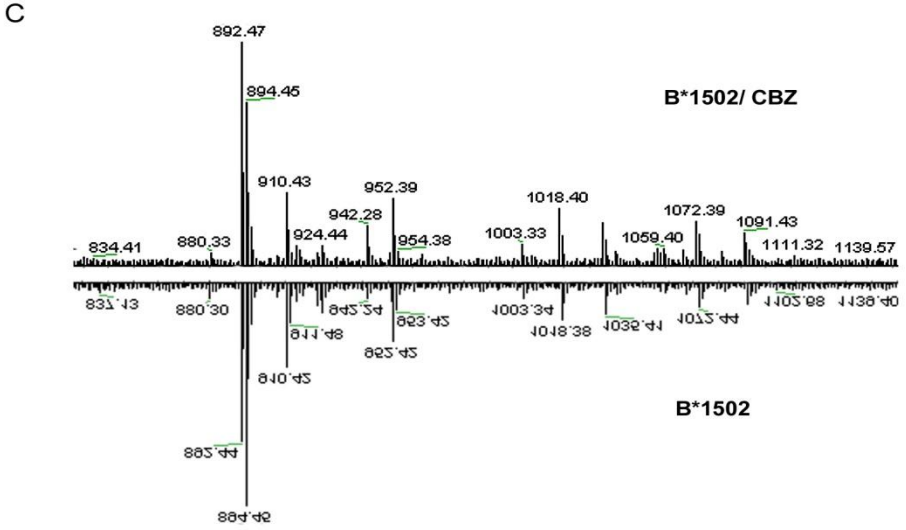
(ca 20% of peptides are altered, 80% not altered; described for very high ABC concentrations (100μg/ml)) (Illing P et al, Nature 2012)

Peptide repertoire: CBZ-HLA-B*1502 model

Using LC-MS/MS to investigate the peptides bound by HLA-B*1502.



B*1502 peptides + CBZ



B*1502 peptides

➔No detection of CBZ covalently modified peptides.

➔No detection of altered self-peptide repertoire

Ou Yang CW, et al., JACI, 2007

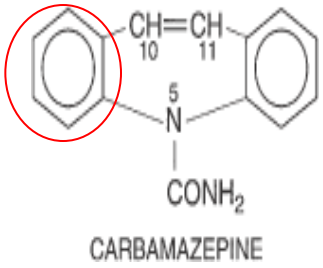
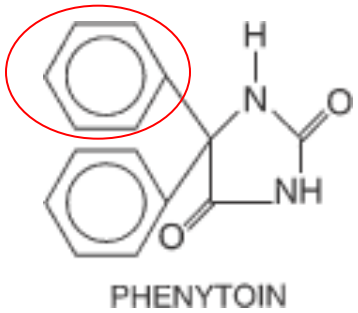
Is HLA-B*1502 as marker for phenytoin-induced SJS/TEN?



CARBAMAZEPINE



PHENYTOIN

Genotype	**PHT-SJS/TEN** (case: 24 vs. PHT tolerant: 103) case/tolerant(**p value/ OR**)	**PHT-MPE/HSS** (case: 38 vs. PHT tolerant: 103) case/tolerant(**p value/OR**)
HLA-A		
*1101	14/49(0.47/1.54)	28/49 (0.01/3.01)
*2402	6/32 (0.736/0.76)	8/32 (0.337/0.59)
*3101		.16)
HLA-B		
*1502	9/8 (p=4.3x 10^{-4}, OR: 7.13)	4/8 (**0.856/1.40**)
*4001	5/38(0.208/0.45)	11/38 (0.497/0.70)

Only weak association with SJS/TEN

GWAS: 60 phenytoin-induced SCAR (38 SJS/TEN, 22 DRESS) v.s. 412 subjects of general population, Taiwan

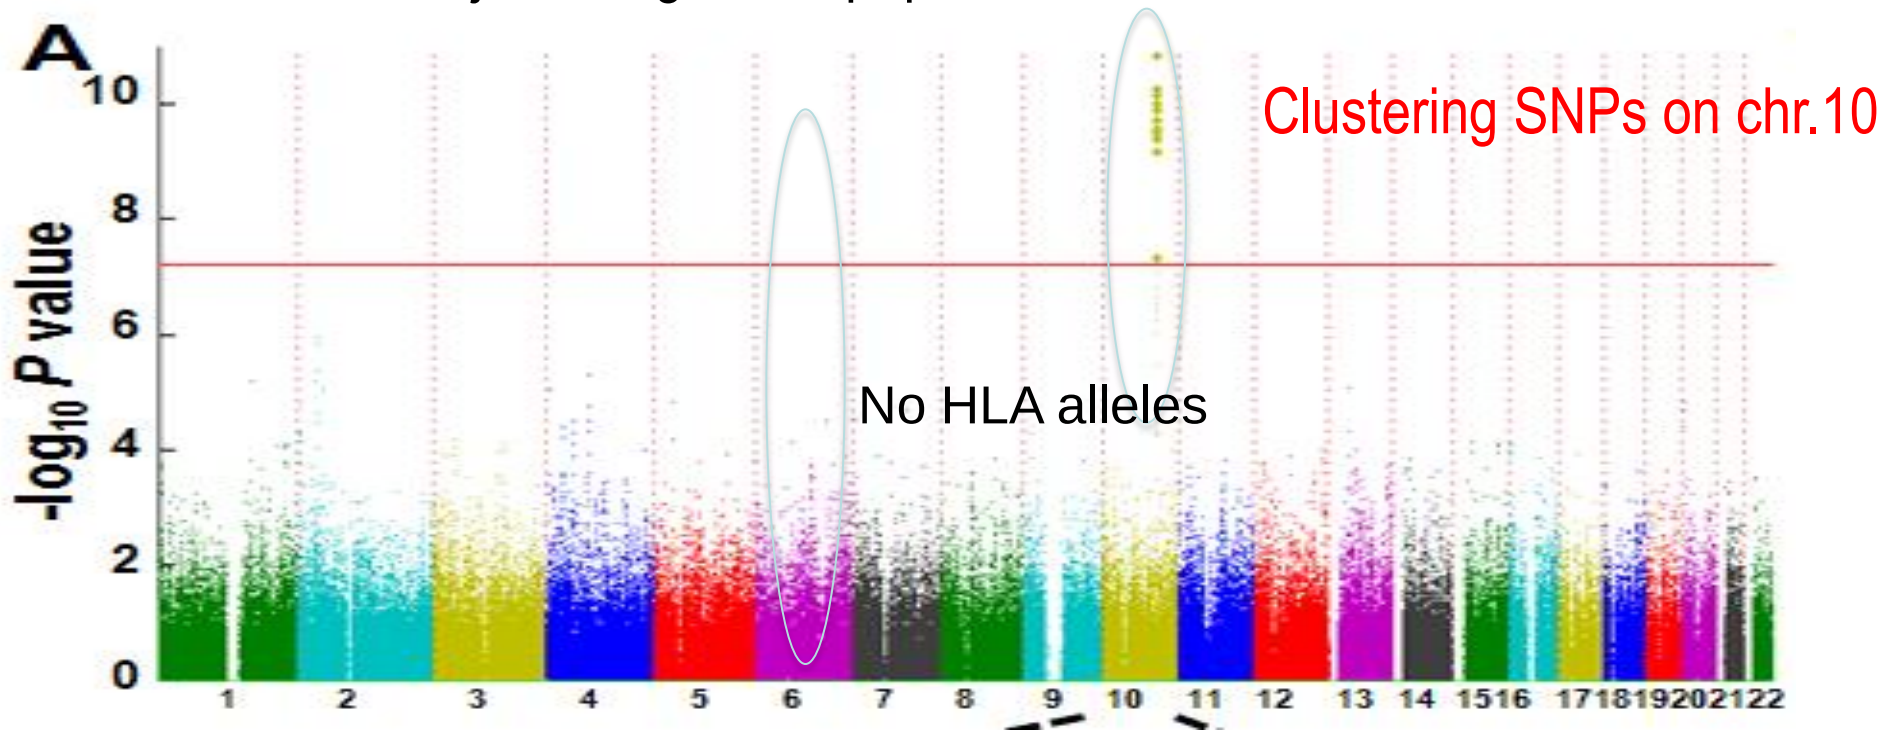

Figure 2. Linkage Disequilibrium Heat Maps for the *CYP2C* Region Associated With Phenytoin-Related Severe Cutaneous Adverse Reactions

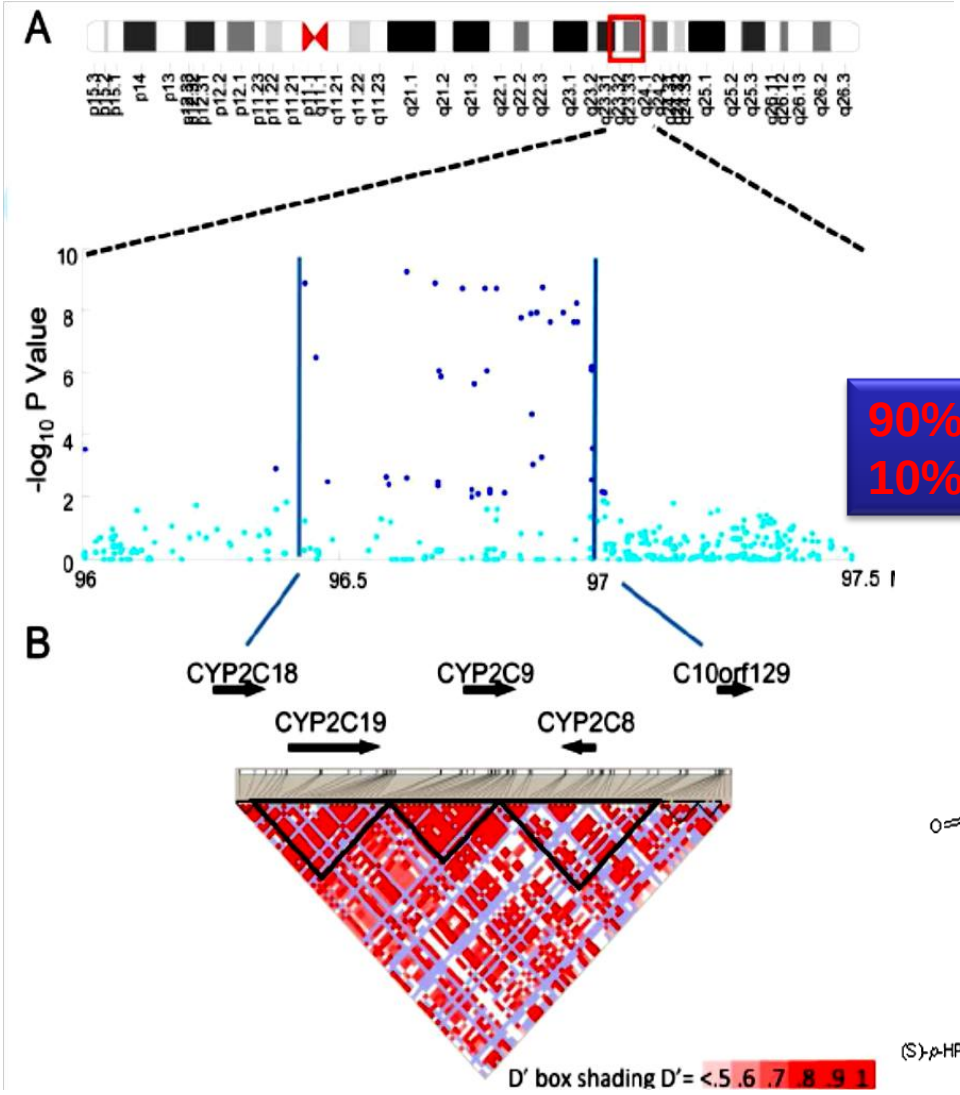
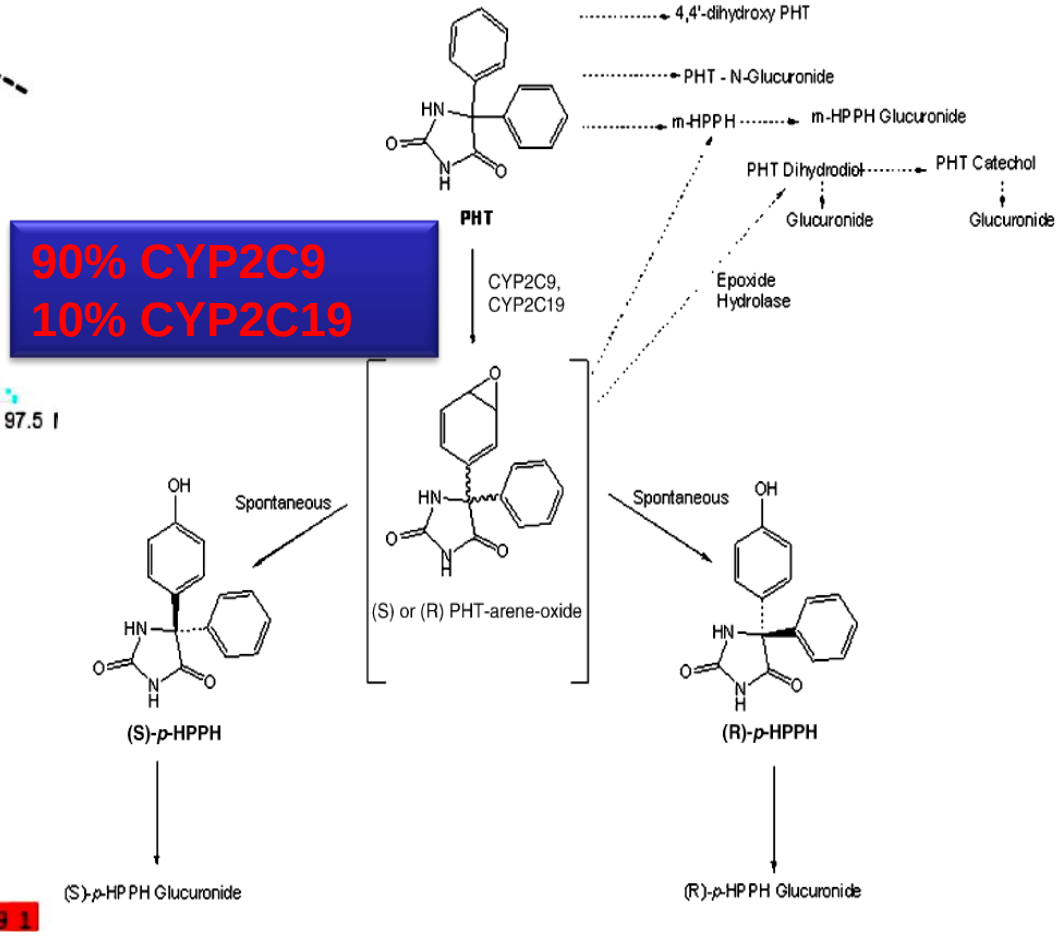


The major metabolizing enzymes of Phenytoin



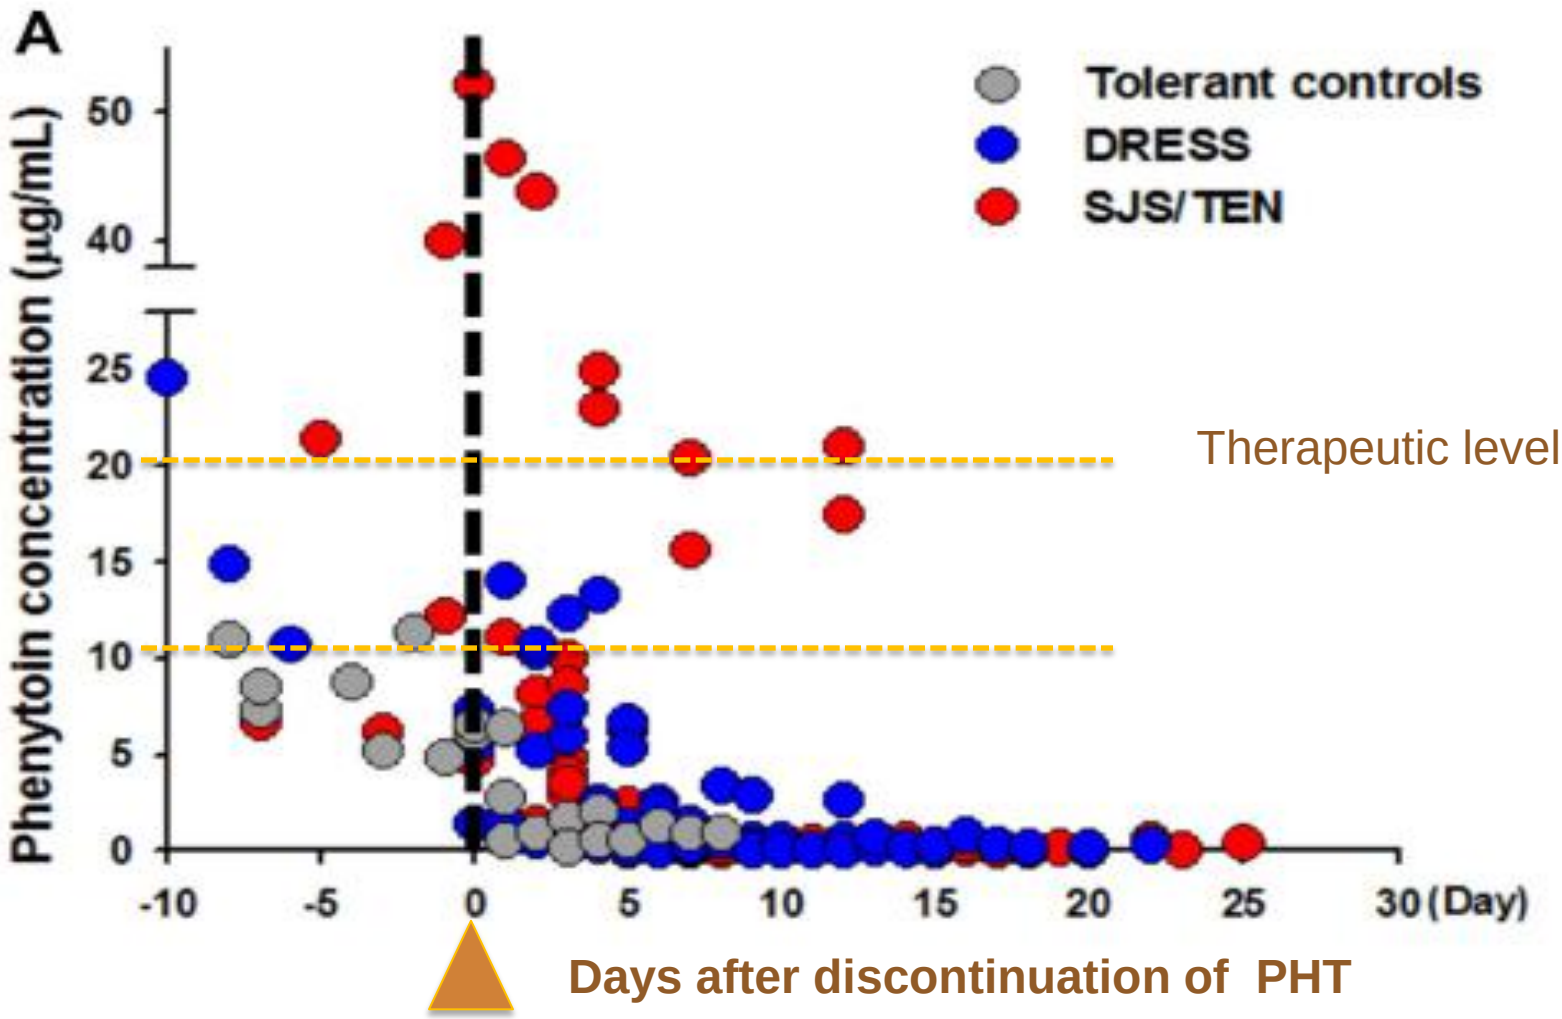
CYP2C*3 is strongly associated with PHT-SJS/TEN & DRESS, but less with PHT-maculopapular exanthem

eTable 7. Association of rs1057910 (*CYP2C9*3*) with phenytoin-induced cutaneous adverse reactions.[+]

Subgroup (Participants number, *N*)	Positive Participants *N* (%)	*P* value	ARR (95% CI)	Odds Ratio (95% CI)	Sensitivity (%) (95% CI)	Specificity (%) (95% CI)
Tolerant controls (130)	3 (2.3%)					
SCAR (90)	33 (36.7%)	5.7×10^{-12}	-0.34 (-0.45 to -0.24)	25 (7.2-83)	36.7 (27-48)	97.7 (93-99)
SJS/TEN (48)	20 (41.7%)	1.2×10^{-10}	-0.39 (-0.54 to -0.25)	30 (8.4-109)	41.7 (28-57)	97.7 (93-99)
DRESS (42)	13 (31.0%)	7.0×10^{-7}	-0.29 (-0.43 to -0.14)	19 (5.1-71)	31.0 (18-47)	97.7 (93-99)
MPE (78)	9 (11.5%)	0.011	-0.092 (-0.17 to -0.017)	5.5 (1.5-21)	11.5 (6-21)	97.7 (93-99)
Population controls (412)	20 (4.9%)					
SCAR (90)	33 (36.7%)	1.3×10^{-14}	-0.32 (-0.42 to -0.22)	11 (6.1-21)	36.7 (27-48)	95.2 (92-97)
SJS/TEN (48)	20 (41.7%)	1.3×10^{-11}	-0.37 (-0.51 to -0.23)	14 (6.8-29)	41.7 (28-57)	95.2 (92-97)
DRESS (42)	13 (31.0%)	8.6×10^{-7}	-0.26 (-0.40 to -0.12)	8.8 (4.0-19)	31.0 (18-47)	95.2 (92-97)
MPE (78)	9 (11.5%)	0.033	-0.067 (-0.14 to 0.007)	2.6 (1.1-5.9)	11.5 (6-21)	95.2 (92-97)

[+]The reported data are based on the analysis of the dominant-inheritance model for the risk genotype. Abbreviations: ARR, absolute risk reduction; CI, confidence interval; DRESS, drug reaction with eosinophilia and systemic symptoms; MPE, maculopapular exanthema; SCAR, severe cutaneous adverse reactions; SJS/TEN, Stevens-Johnson syndrome/toxic epidermal necrolysis.

Poor metabolism of phenytoin in the PHT-SCAR patients



The levels of plasma phenytoin were measured by fluorescence polarization immunoassay analysis.

Same significant association of *CYP2C9*3* with PHT-SCAR was observed in patients from Taiwan, Japan, and Malaysia

Figure 3. Distribution of the *CYP2C9*3* Variant in Cases With Phenytoin-Related Severe Cutaneous Adverse Reactions and Population Controls

Subgroup	Cases of Phenytoin-Related Severe Cutaneous Adverse Reactions, No.		Population Controls, No.		Odds Ratio (95% CI)

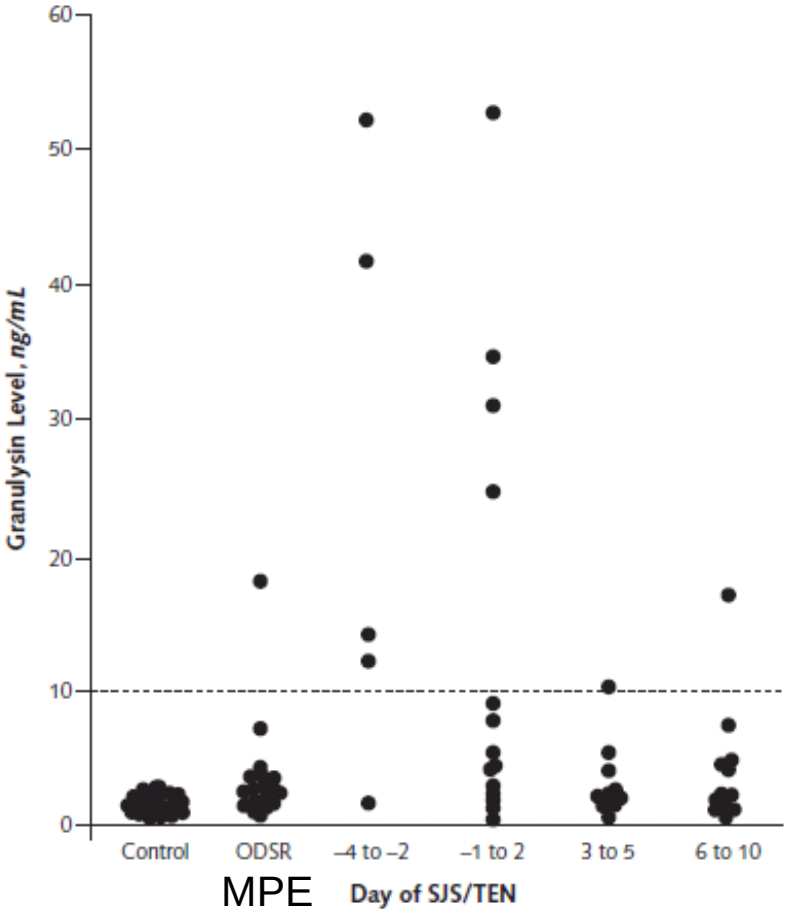
Figure. **Granulysin levels of healthy control participants, patients with ODSRs, and patients with SJS/TEN.**



MPE

ODSR = ordinary drug-induced skin reaction; SJS/TEN = Stevens–Johnson syndrome/toxic epidermal necrolysis.

SJS caused by mortrin?

Comparison of *in vitro* tests to detect the causative drugs for the type IV (delayed type) drug hypersensitivity

Test	Method	Limitation
1. lymphocyte transformation test (LTT)	Measure the cell proliferation	Radioactivity; expensive equipment
		Need well-trained technicians
		Sensitivity for the detection of causality of MPE: 57%-78% **Sensitivity for the detection of causality of SJS/TEN: <20%**
2. Detection of CD69 expression on **Th1** cell surface	Flow cytometry	CD69: a marker of early T cells activation, is associated with Th1 T cell differentiation. Only 0.5-3% T cells expressing CD69
3. Cytokine expression and secretion (IL2, IL5, IFNγ)	ELISA	These cytokines are not specific for delayed-type drug hypersensitivity Poor results of the sensitivity and specificity

Nyfeler et al, 1997; Luque et al, 2001 Pichler et al, 2004, Fu and et al, 2012

Cytokines& chemokines in SJS/TEN

SJS or TEN related cytokines and chemokines.

Cytokines/chemokines	Functions	Blister cell	Blister fluid	Skin tissue	PBMC	Serum
TNF-α [55,60,62]	Inflammation, apoptosis	NS[a]	+	+	+	
IFN-γ [55,60,62]	Activation of immune cells	+	+	+	+	
IL-2 [55,62]		NS	NS	+	+	
IL-5 [62]	Acute phase response			+		
	Proinflammatory cytokine					
	Antiinflammatory cytokine					
IL-6 [58,59,62]	Acute phase response			+	+	+
	Pro-inflammatory and anti-inflammatory cytokine					
IL-10 [59,60]	Anti-inflammatory cytokine	NS	+		+	+
IL-12 [60]	Activation of NK and CTL		NS			
IL-13 [62]				+		
IL-15 [60]	Regulation of T and NK cell activation and proliferation		+/–			
IL-18 [60]	Stimulation of the growth of T lymphocytes		++			
CCR3 [62]	Binding chemokines (eotaxin, MCP-3, MCP-4, and RANTES)			+		
CXCR3 [62]	Regulation of leukocyte trafficking			+		
CXCR4 [62]	Chemotactic activity for lymphocytes			NS		
CCR10 [61]	Trafficking leukocytes				+	

TNF-α, tumor necrosis factor-alpha; IFN-γ, interferon-gamma; IL, interleukin; CCR, C–C chemokine receptor; CXCR, CX chemokine receptor; +, positive; –, negative.

[a] NS, not significant.
