

# ***Genomic Medicine: Regulatory Science Perspective***

**House of Lords Inquiry on Genomic  
Medicine Visit  
Lawton Chiles International House  
June 6, 2008**

Lawrence J. Lesko, Ph.D., FCP  
Director, Office of Clinical Pharmacology  
Center for Drug Evaluation and Research  
Food and Drug Administration  
Silver Spring, Maryland, USA

# Century-Old Challenge: Identifying Causes of Variability in Medicine

“If it were not for the great *variability* among individuals, medicine might have well been a science and not an art”

Sir William Osler (1849 – 1919)  
The Father of Modern Medicine

“One important characteristic of biology is its diversity, its *variation*. It’s why personalized medicine is so important”

Dr. Andy Kessler  
NY Times Best Selling Author (2005)

# What I Will Address in My Presentation

- Why genomic applications are important to new drug development
- How genomic knowledge can be used to improve previously approved drugs
- What are the challenges and solutions to further enabling genomics

# Conceptual Foundation for Policies in Genomic Medicine and Pharmacogenomics

Personalized Health Care Initiative of HHS Secretary Michael Leavitt (2007)

<http://www.hhs.gov/myhealthcare/>

Critical Path Initiative of FDA Director of CDER Janet Woodcock (2005)

<http://www.fda.gov/oc/initiatives/criticalpath/whitepaper.pdf>

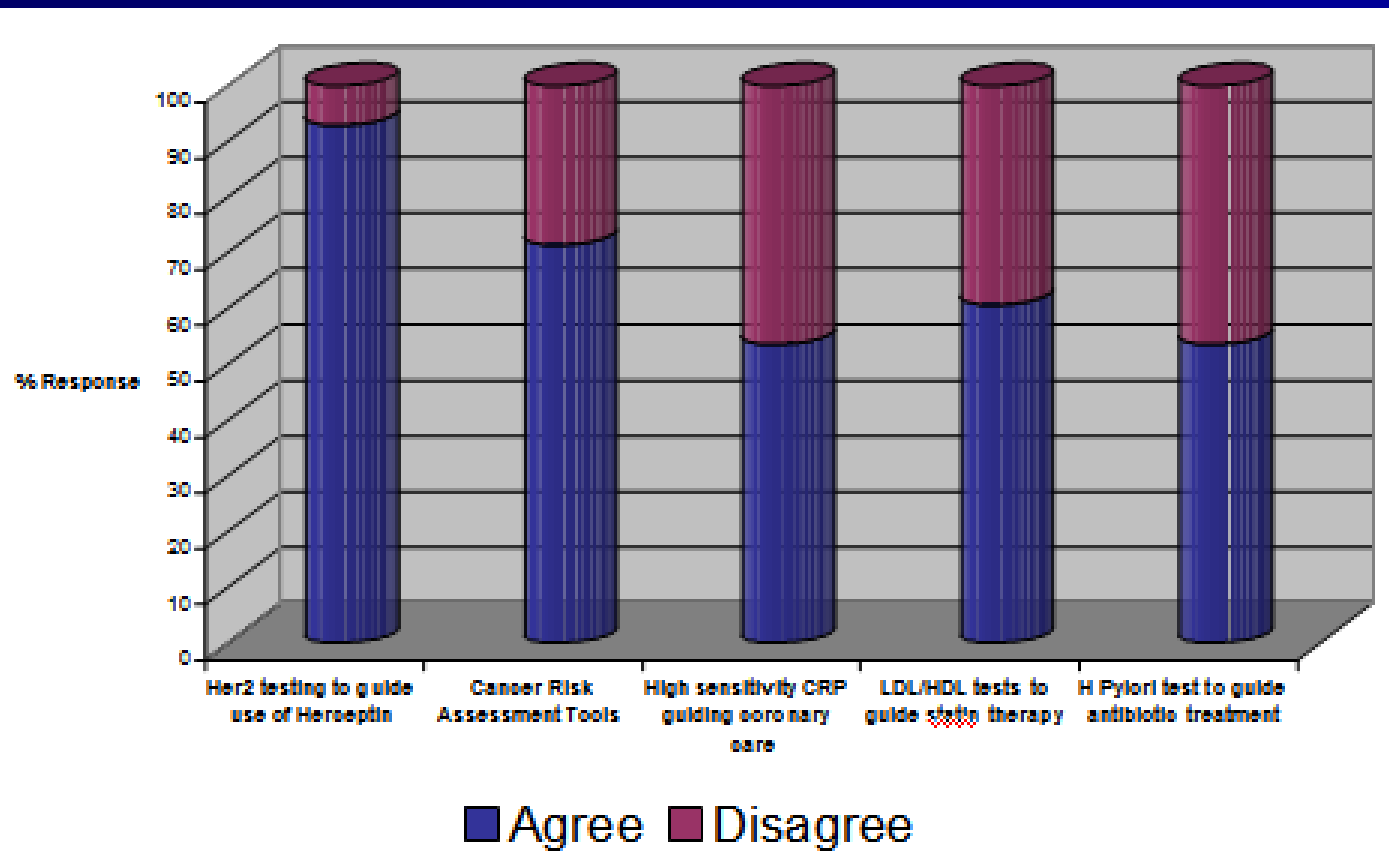

# Genomic Medicine Is A Component of Personalized Health Care

Science of using genomic biomarkers as diagnostic tests to target therapies

1. Total patient populations are “stratified” into subgroups based on similar test results
2. Subgroups of patients follow different treatment strategies with “probabilities” for outcomes

# Personalized Health Care Doesn't Have to Be Based Only on Genomic Biomarkers

## Are These Cases of Personalized Medicine?

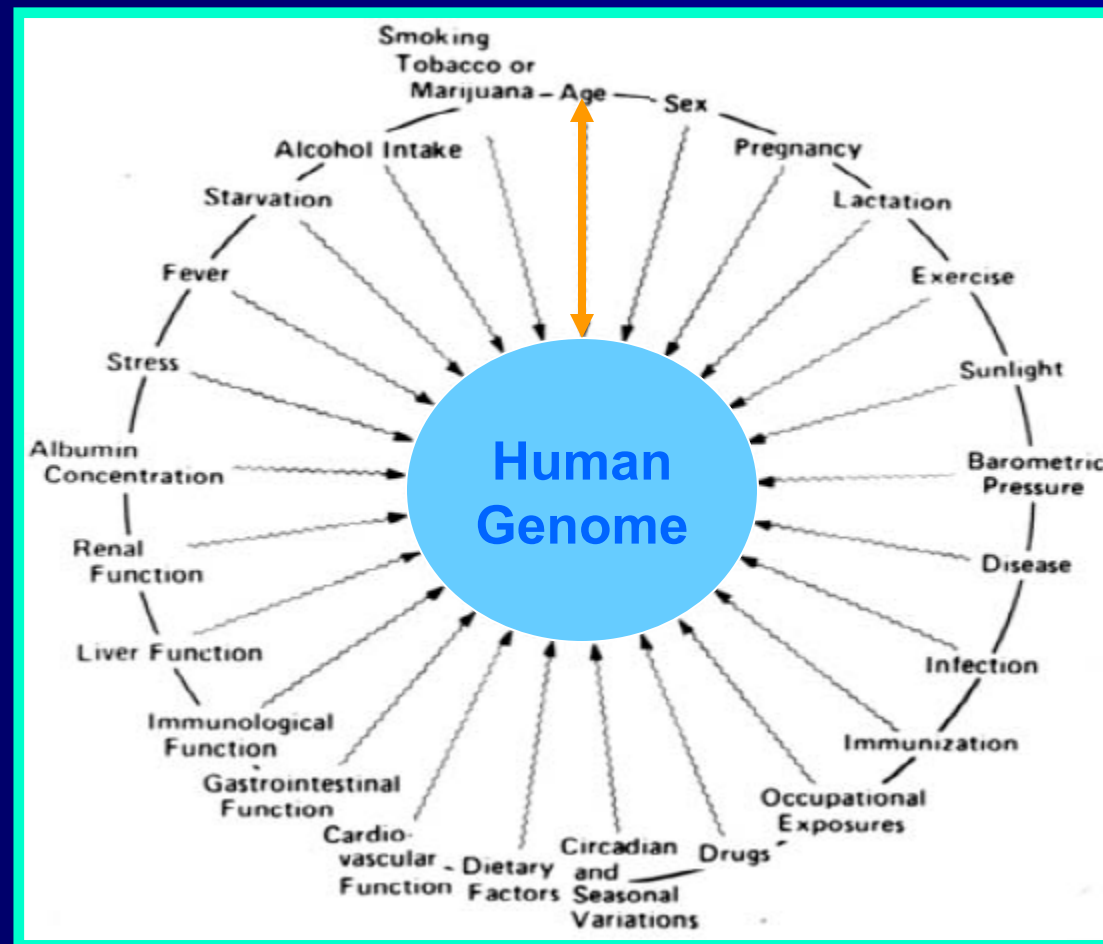

# Pharmacogenomics: Component of Genomic Medicine

- Science of using inherited variations in genes that influence drug selection, drug exposure (PK) and/or drug action (PD)
- Genomic biomarkers: measurable DNA or RNA characteristics in human, tumor or virus samples that are indicators of
  - Normal biologic processes
  - Pathogenic processes
  - Response to drugs

*Source: Adapted from ICH E15 Guideline on Definitions and Coding, January 2008*

# Genomics: Understanding Heterogeneity in Disease Biology and Drug Response

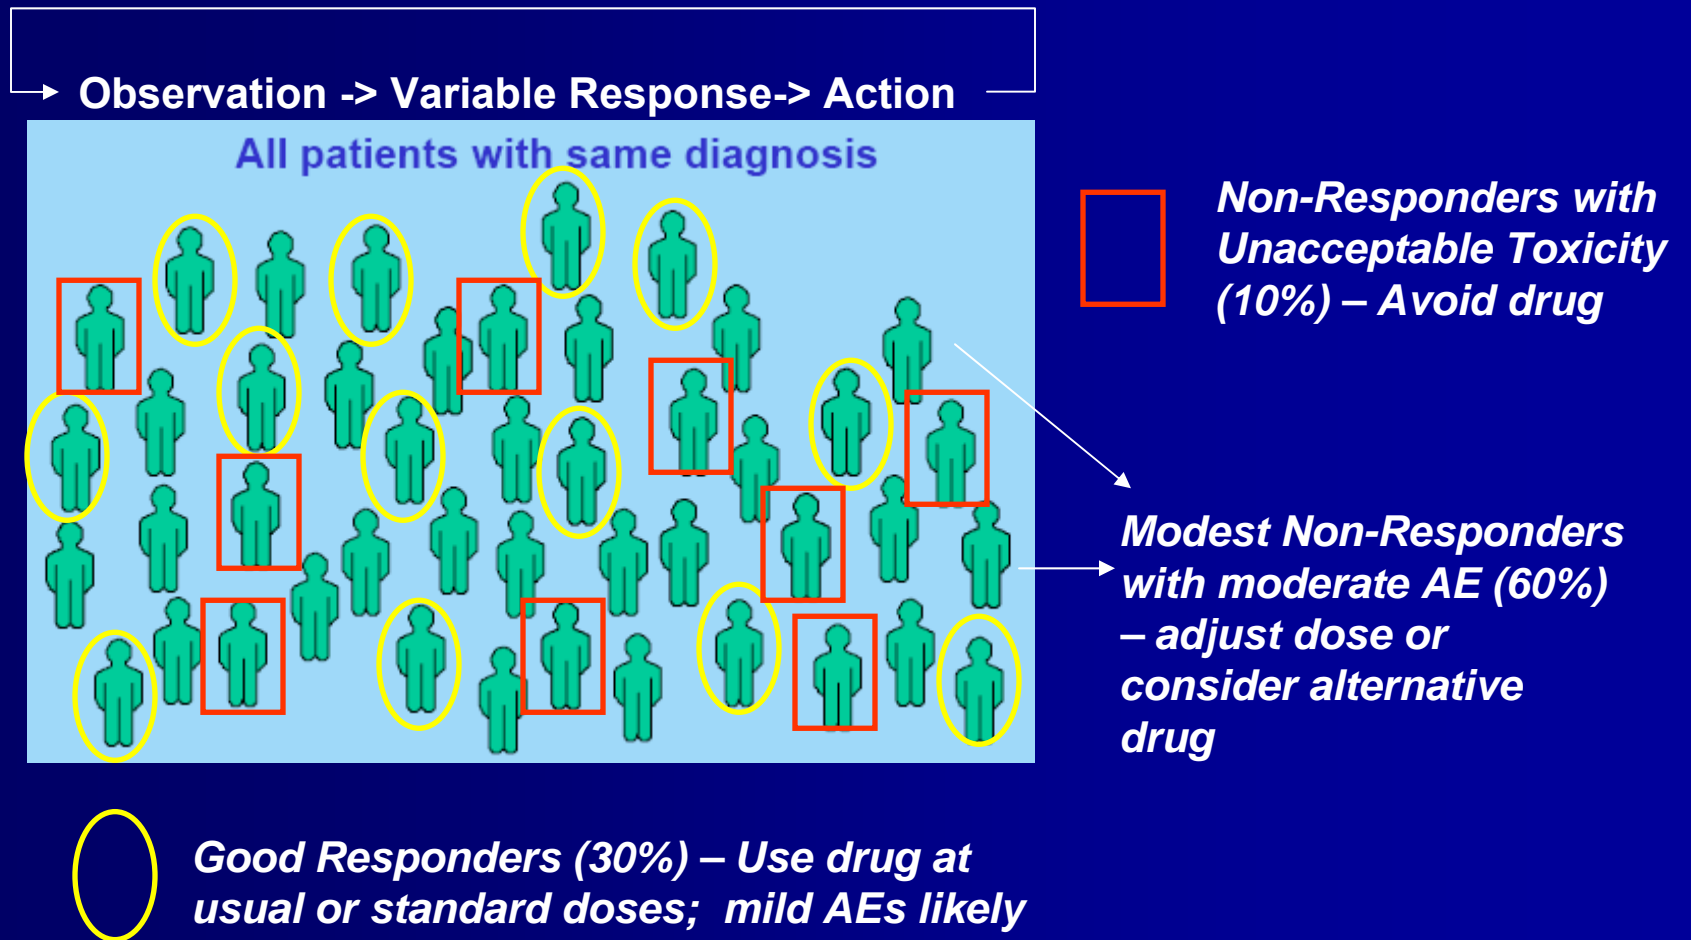

## Once the Symptoms and Diagnosis Is Complete

Physicians have basically two decisions to make when treating patients:

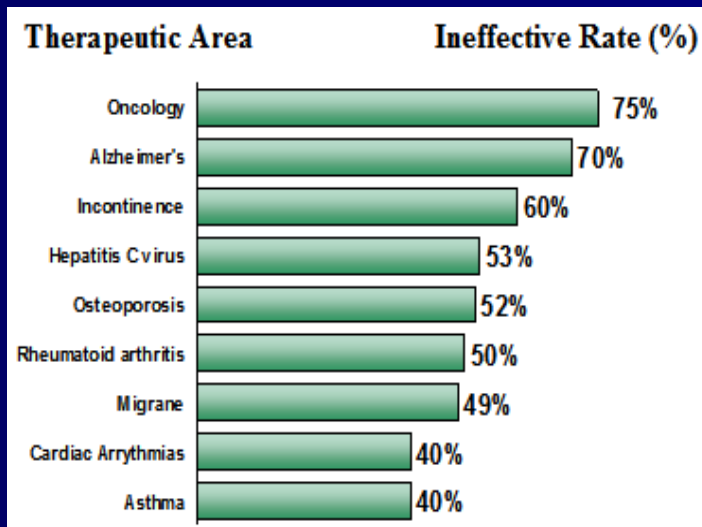

1. Selecting the right drug
2. Choosing the right dose

# Consequences of Empirical, Not Mechanistic, Approach to Medicine

# Fundamental Paradox: Develop Drugs for Populations But Treat Individual Patients

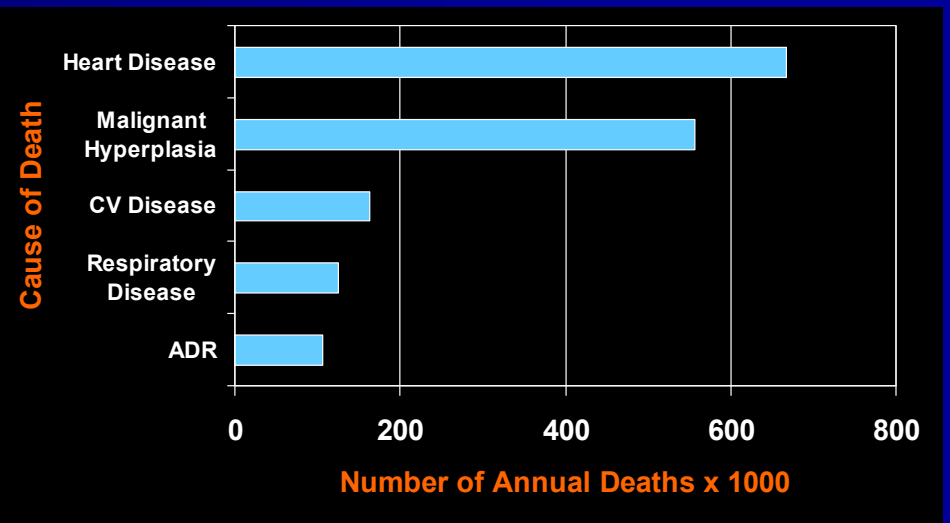

**Benefit:**

**Will This Drug Work for Me?**

**Risk:**

**Will This Drug Hurt Me?**

**THE WALL STREET JOURNAL.**

As of 9:30 a.m. EST Friday, February 29, 2008

## **Heightened Media Challenges**

### ***FDA to Increase Warnings and Advisories on Side Effects***

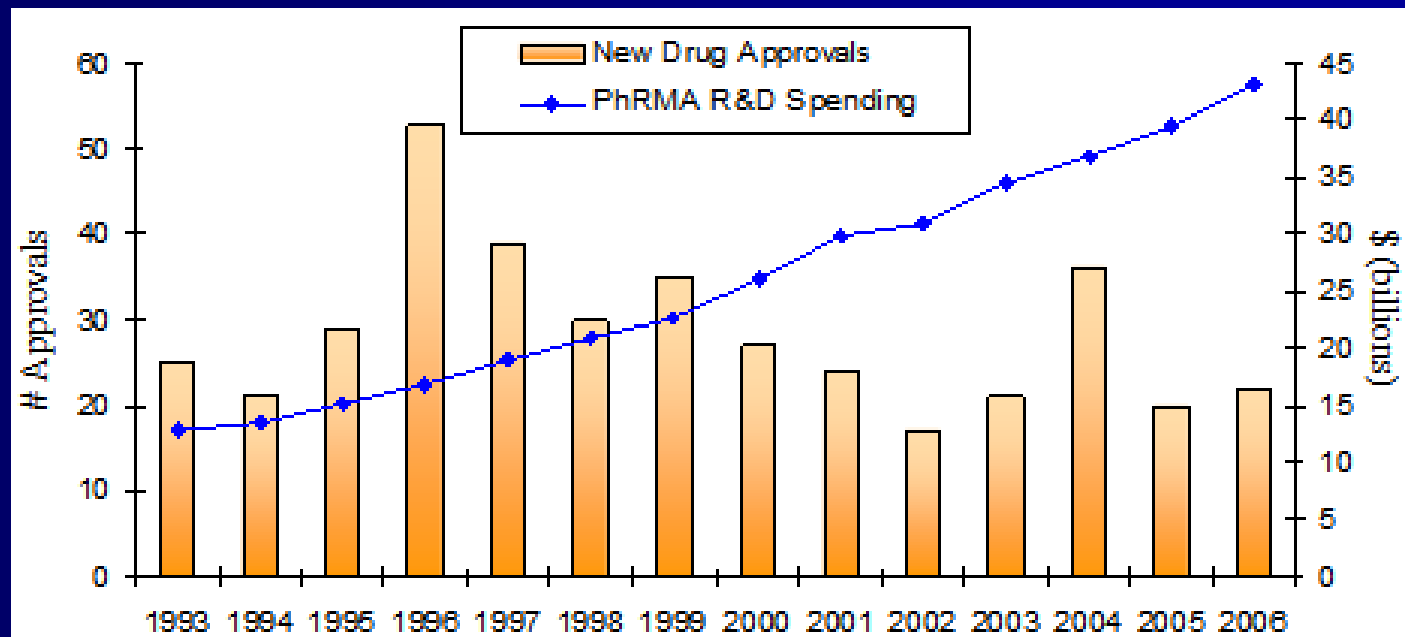

*Wall Street Journal, Feb 29, 2008*

**“Consumers will know we are the case. The Agency’s goal is to find out which consumers benefit the most from a particular drug and which ones should avoid it, rather than pulling drugs off the market. This notion is becoming more of a reality with increased use of genetic testing.”**

**Dr. Janet Woodcock, Director  
Center for Drug Evaluation and Research  
Food and Drug Administration**

# Consequences to Studying Drugs in Total Populations

## Improve Productivity of New Drug Development

- Success rates of phase 3 trials is 56%
- Attrition in 1/2 of cases is due to lack of efficacy-
- 1/3 of failure rate is lack of differentiation
- Formula for success = signal/noise x square root of sample size

# How Can We Do Better? How Can We Increase Benefit or Decrease Risk?

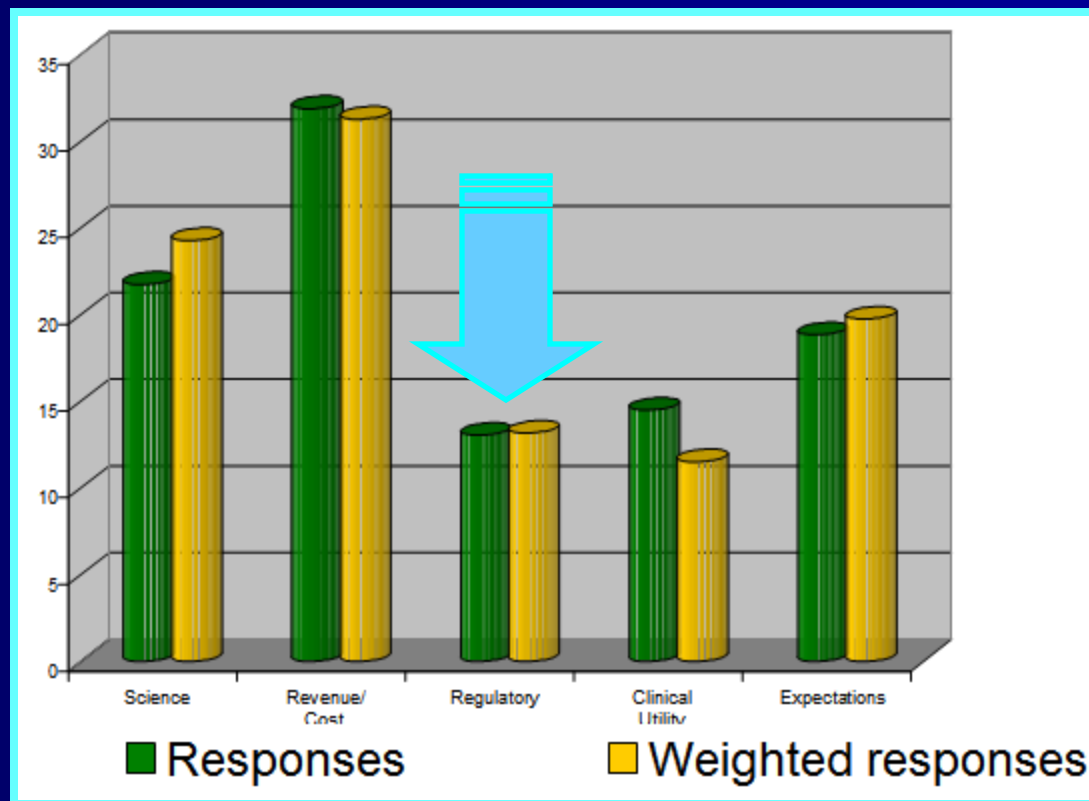

**Albert Einstein**  
**(1879 – 1955)**

**“We can't solve problems by using the same kind of thinking we used when we created them”**

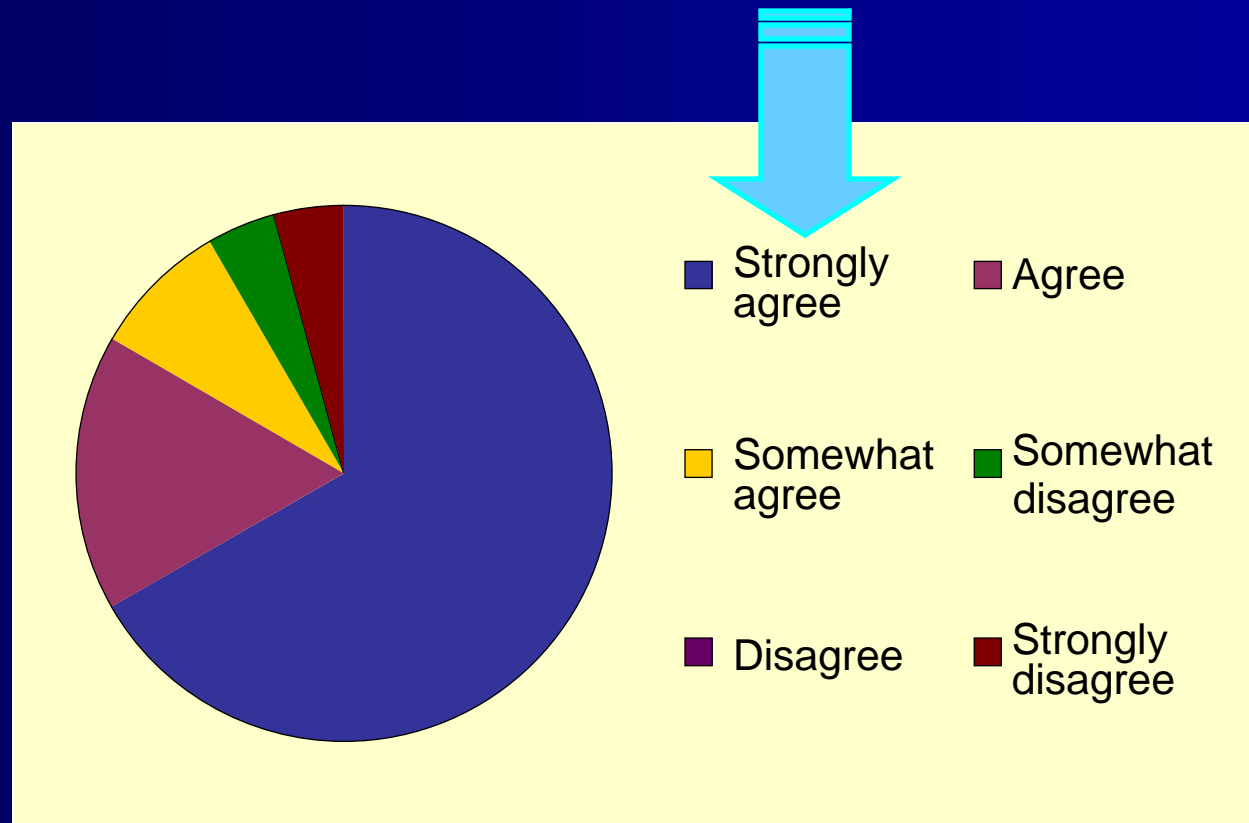

**“Insanity is doing the same thing over and over again and expecting different results”**

# Five Biggest Obstacles to Genomic Medicine and Pharmacogenomics

**Protect and Promote  
Public Health**

# Knowledge of Disease Biology and Drug Pharmacology Is Key Prerequisite

Source: Gage and Eby, *Pharmacogenomics J*, 2004

# Re-Labeling Previously Approved Products With Genomic Medicine

## *Efficacy: Test Required*

Drug	Test
Trastuzumab	HER2 Receptor Positive
Imatinib	C-Kit (CD117) Positive
Rituximab	CD20 Positive B-Cell NHL
Cetuximab	EGFR Expression +
Erlotinib	EGFR Expression +
Maraviroc	CCR5-Tropic HIV-1 Positive

## *Safety: Test Recommended*

Drug	Test
6-MP	TPMT Genotyping
Camptosar	UGT1A1 Genotyping
Warfarin	2C9, VKORC1 Genotyping
Ziagen	HLA-B5701 Variants
CBZ	HLA-B1502 Variants
Atomoxetine	2D6 Genotyping

# What Other Genomic Biomarker Can Reduce AEs by 50% and Save \$900 Per Person?

FDA Label for Warfarin Changed August 2007 to Mention P-genomic Testing in Initial Dosing

*"This marks the first time such pharmacogenetic information has been included in a widely used drug....*

*This means personalized medicine is no longer an abstract concept, but has moved into the mainstream, where it is recognized as a factor in a product used by millions of Americans every day."*

— Lawrence J. Lesko, Ph.D., F.C.P.  
Director,  
Clinical Pharmacology Division  
FDA

November 2003  
Reproducible

- Need to build trust that genomics would not be used prematurely
- Need to learn from each other about potential applications
- Need to standardize collection, storage and reporting of data

New VOLUNTARY GENOMIC DATA SUBMISSION pathway as a building block for expansion of genomics into the drug development process

[www.fda.gov/CDER/guidance/5900dft.doc](http://www.fda.gov/CDER/guidance/5900dft.doc)

## Providing Advice Within the VGDS Program

- Approximately 45-50 voluntary submissions from 12-15 different companies
- Provided shared access to experiments related to
  - Gene mapping and sequencing
  - Genome wide association studies
  - Population genetics
  - New biomarkers
  - Innovative clinical trial designs
  - New “omics”
- Program expanded to collaboration and shared VGDS meetings with EMEA and PDMA

# Developing Policies Based on Experience Gained With The VGDS Program

- Biomarker qualification pilot process
  - Provide more rapid “validation” of biomarkers with a defined context for use (“fitness for purpose”)
  - Address uncertainties related to sensitivity and specificity of biomarker “tests”
  - Compare performance (“predictability”) and incremental value to established reference test
- Case study: preclinical nephrotoxicity biomarkers
  - Multiple data sources from industry consortium
  - Review conducted by multidisciplinary review team
  - Sign-off of “validation” package at CDER Director level
  - Joint review with EMEA

# Guidance Development Is a Continuous Process to Provide a Regulatory Framework

## Guidance for Industry

## Table of Valid Genomic Biomarkers in the Context of Approved Drug Labels

Pharmacogenomic information is contained in about ten percent of labels for drugs approved by the FDA. A significant increase of labels containing such information has been observed over the last decade. In order to provide a reference for genomic biomarkers in labels of FDA-approved drug products, we created the table shown below. Genomic biomarkers can play an important role in identifying responders and non-responders, avoiding toxicity and adjusting the dosage of drugs to optimize their efficacy and safety. In the context of drug labels, these genomic biomarkers can be classified on the basis of their specific use, for example:

- ◆ Clinical response and differentiation,
- ◆ Risk identification,
- ◆ Dose selection guidance,
- ◆ Susceptibility, resistance and differential disease diagnosis,
- ◆ Polymorphic drug targets.

## Personalized health care report 2008: Warfarin and genetic testing

Twenty-one percent of patients who receive anticoagulant therapy experience either major or minor bleeding events. Knowing a patient's genotype may aid in initial warfarin dosing.
